

OpenELEC 6.0 beta announced for download

The OpenELEC development team, through Stephan Raue, has announced the general availability for download and testing of the first beta version of OpenELEC 6.0, a Linux kernel based operating system for embedded devices.

Powered by Linux kernel 4.0 and Kodi 15.0 (Isengard), a popular media centre application that was previously known as XBMC Media Center, OpenELEC 6.0 Beta 1 has a number of interesting new features, but also improves performance and addresses some of the bugs that were present in previous versions of the project.

"The most visible change is the update from Kodi-14.2 Helix to Kodi-15.0 Isengard (beta 1)," says Stephan Raue. He adds, "Beginning with Kodi-15, most audio encoder, audio decoder, PVR and visualisation additions are no longer included in our base OS, but they are available via Kodi's add-on manager and must be installed from there, if needed."

Another interesting feature in OpenELEC 6.0 Beta 1 is that it drops support for 32-bit hardware architectures. The 64-bit generic builds now contain the latest Nvidia GPU drivers, and there's support for WeTek Play devices. Most of OpenELEC's core components have been updated as well, including FFmpeg 2.6, Mesa 10.5, systemd 219, Binutils 2.25, LLVM 3.6, Glibc 2.21, and libressl 2.1.6. Support for X.Org's new libinput based input driver system has also been implemented.

Last but not least, the iMX6 build of OpenELEC 6.0 now supports all Solidrun CuBox-i/TV devices, OSMC's Vero, as well as Solidrun Hummingboard. Several other components have also been updated to their latest versions.

factors, including rigid proprietary stacks, inflexible licensing agreements, and legacy silos in IT can prevent enterprises from achieving the agility they need

to stay competitive. Enterprises are increasingly implementing DevOps methodologies, and technologies that complement them, to break down siloed communications between

development and operations teams, and accelerate application development and delivery. As DevOps adoption increases, so does the demand for technologies that complement DevOps methodologies, and enable high productivity of developers and operations teams working closely together.

Red Hat's JBoss EAP supports a broad range of third-party frameworks, operating systems, databases, security and identity systems to make integration into existing infrastructure easier. In addition, new subscription flexibility expands support for customers deploying JBoss EAP across multiple environments based on their individual needs and business requirements, including on-premise, in a PaaS environment, or in hybrid cloud scenarios.

Additional enhancements introduced in JBoss EAP 6.4 include:

- Support for Java 8 applications, as well as for the Java API WebSockets implementation protocol; JSR 356 that enables developers to build real-time, rich client and mobile applications with reduced overhead and complexity.
- Expanded JBoss EAP console and Red Hat Customer Portal integration, giving users direct access to the Red Hat Customer Portal, including the ability to receive support, open and manage tickets, and access the knowledge base.
- New console functionality with an updated user interface enabling users to view log files more easily and manage security configuration for applications.
- Kerberos authorisation for greater application security.

The combination of JBoss EAP and OpenShift Enterprise helps enterprises to optimise both development and operations by offering the ability to build enterprise-grade Java applications in a streamlined PaaS environment, more quickly.

LIVA X: A small and capable mini PC

Elitegroup Computer System (ECS) has introduced its latest mini PC – the LIVA X. It has a fan-less design, supposedly emits zero noise and saves power. Adopting the Intel Bay-Trail M SOC and the 15W ultra-low power design, it supports the Windows 8.1, Windows 7, Linux and Ubuntu operating systems. Moreover, users could upgrade to Windows 10 for free, once it's made available. The LIVA X supports USB 3.0, Wi-Fi and Bluetooth, and its storage capacity can be upgraded via mSATA SSD. The most important is the size of the LIVA X.

While launching the PC in New Delhi, Sunny Yang, GM, ECS, said, "We believe that the concept of the mini PC is a fast growing trend within the Indian tech-savvy community. Users who are at home or even at office are looking for the most convenient way to enjoy video, music, gaming and, of course, business PC usage. The end user needs should be designed to provide the best possible video and audio, ensure extremely efficient power
