

consumption, offer sufficient cooling, and maintain low noise levels. People want the entertainment features and a stylish look in a small size without compromising on performance, for the home and office. I can proudly say that only LIVA X can make all this happen. Meanwhile, we are delighted that we have been associated with Amazon.in and Flipkart in India. It's a great moment for us to go deep into the Indian market."

"Intel has always strived to bring the best of computing technology to its consumers, across form factors. We would like to congratulate ECS on the launch of the Intel processor powered Liva X mini PC, which achieves the ideal balance between great performance, energy efficiency and battery life," said Amit Gupta, director business development, Intel South Asia.

India country manager for ECS, Rajshekhar Bhatt, commented that, "The Windows 8.1 version with 32GB eMMC storage and 2GB DDR3L costs Rs 14,900, and the 32GB eMMC storage and 2GB DDR3L without the Windows OS is for Rs 11,900. These will be available at a special introductory discount of approximately 12 per cent on MRP at Amazon and Flipkart. The price for the mini PC has never been that competitive in India. The LIVA series will be able to give a strategic thrust to the feature-rich mini PC product line with improved technology, taking it to a higher level. With ECS innovation and reliability, we are looking forward to seeing these products setting a benchmark in India."

The LIVA X is about the size of your palm! Thanks to the native VESA mount, you can place it practically anywhere - behind displays, monitors and TVs. This doesn't only save space, but it's also the easiest way to create a cable-free environment.

HP leads industry to new school of cyber defence

HP has unveiled new security offerings to help organisations embrace a

'New School of Cyber Defence' by protecting the interactions between users, applications and the boundless data exchanged to safely fuel growth and innovation. As information flows through data centres to the cloud and out to personal devices, the data must be secured at every step. The new HP security products and services address this approach to security, incorporating user behaviour analytics, data-centric

cloud access protection, mobile application reputation analysis, contextual threat intelligence sharing, and incident response.

Organisations worldwide spent approximately US\$ 77 billion on cyber security in 2014 while successful breaches increased 25 per cent. Threats continue to evolve as organisations increasingly adopt new ways of doing business—and the current approach to securing interactions between users, applications and data isn't keeping up.

"The old school approach to cyber security focused on securing the perimeter, but the data powering business today goes beyond our four walls and must be protected from cyber threats regardless of where it resides. In today's environment, we must challenge ourselves to embrace the new school of thinking that goes beyond the infrastructure to protect what matters most — the interactions between users, applications and data—that when protected, can fuel our businesses and accelerate growth," said Jyoti Prakash, country director, India and SAARC countries, HP Enterprise Security Products.

Pivotal and Mirantis partner to deliver Cloud Foundry on OpenStack

Mirantis, the pure OpenStack company, has forged a partnership with Pivotal to integrate and deliver the Cloud Foundry based PaaS on OpenStack based cloud infrastructure. Under the deal, Pivotal will support Pivotal Cloud Foundry, a distribution of Cloud Foundry, on Mirantis OpenStack. In addition, Mirantis will now also resell Pivotal Cloud Foundry to customers. This partnership between the two players from the Cloud Foundry and OpenStack ecosystems enables enterprises to confidently invest in a cloud stack built on integrated, open and fully supported technologies.

"Our joint customers are seeking open, bleeding-edge technologies to accelerate their software development and bring new products to market faster," said James Watters, vice president and general manager of the Cloud Platform Group at Pivotal. "Now, with Pivotal Cloud Foundry and Mirantis OpenStack, enterprises across various industries can rapidly deliver cloud-native, scalable applications to their customers with minimal risk and maximum ROI."

Customers can install Pivotal Cloud Foundry onto Mirantis OpenStack today using the companies' joint deployment guide. The companies intend to extend their partnership in the future by adding a full Pivotal Cloud Foundry installation to the OpenStack Murano application catalogue.

This will allow IT organisations to deploy a complete foundation of Pivotal Cloud Foundry on OpenStack at the click of a button, install stateful services and expose them to running instances of Pivotal Cloud Foundry, and deploy other applications from the Murano application catalogue directly onto running instances of Pivotal Cloud Foundry.
