

CloudBees

CloudBees provides continuous integration and delivery solutions powered by Jenkins CI. The CloudBees PaaS was the first production PaaS for the entire application life cycle, starting from the development to the deployment of an application.

Developer(s): Sacha Labourey

Initial release: 2006

Licence: Proprietary

Website: <https://www.cloudbees.com/>

Supported technology: Java, Jenkins

Features:

- Enables organisations to build, test and deploy applications for different environments

- Enables continuous integration practices with Jenkins
- Utilises continuous delivery practices
- DevOps enablement with continuous integration and delivery

DEV@cloud is a hosted version of Jenkins that eliminates the need to manage and maintain the underlying IT infrastructure

Offerings: CloudBees Jenkins Enterprise, CloudBees Jenkins Operations Center and DEV@cloud; commercial support and additional plugins for open source Jenkins

Pricing: **Enterprise trial:** Two weeks free, **Starter:** US\$ 60/month, **Professional:** US\$ 100/month, **Enterprise:** US\$ 200/month

Free trial: Available

CloudFoundry

CloudFoundry offers a modern approach to technology, which organisations need to excel in a new era of innovation, by streamlining application development, deployment, management and operations on an efficient public or private PaaS platform.

Developer(s): Originally VMware, now owned by Pivotal Software

Initial release: 2011

Written in: Ruby, Go

Licence: Apache License 2.0/Proprietary

Website: <http://cloudfoundry.com/>

Supported technologies: MySQL, PostgreSQL, MongoDB, Redis, Riak, DataStax, Neo4J, Pivotal HD, RabbitMQ, CloudBees Jenkins, API Gateway, Data Sync

Features:

- Automated deployment with easy resource management and administration of applications and services
- Horizontal and vertical scaling on VMware based private clouds
- Built-in services such as load balancing, DNS, logging and auditing, as well as health management
- Java Spring support
- Application binding and service provisioning for pivotal services

Offerings: Commercially supported release based on Cloud Foundry; open source

Free trial: Available

OpenShift

OpenShift is a PaaS from Red Hat that runs the service named OpenShift Origin, available on GitHub. Organisations can use Git to deploy Web applications in different languages on the OpenShift platform.

Developer(s): Red Hat

Initial release: 2011

Written in: Ruby

Licence: Apache License 2.0

Website: <https://www.openshift.com/>

Supported technologies: Java, JavaScript, .NET, Perl, PHP, Haskell, Python, Microsoft SQL Server, MongoDB, MySQL

Features:

- Region and zone management
- Resource management
- Scaling
- Domain management and SSL certificates
- Collaboration - Users and team management, additional domains
- Support - Community support and Silver Plan

Offerings: OpenShift Online (free or premium plans), OpenShift Enterprise (annual software subscription), OpenShift Origin (free and open source)

Free trial: Available
