

Heroku

Heroku is a PaaS that's been in development since June 2007 and was acquired by Salesforce.com in 2010.

Developer(s): James Lindenbaum, Adam Wiggins and Orion Henry

Initial release: 2007

Written in: Ruby

Licence: Proprietary

Website: <https://www.heroku.com/>

Supported technologies: Java, Node.js, Scala, Clojure, Python, PHP, Perl

Features:

- Custom build-back to support languages that are not supported out-of-the-box

- Environment-specific configurations management
 - Over 150 add-ons from the Elements Marketplace
 - Single-click provisioning, configuring and deployment of third party components and libraries
 - Supports two geographic regions — US and Europe
- Offerings:** Dynos are the units of computing power that provide lightweight and isolated containers to run applications in Heroku

Pricing: 1X, 512MB RAM, 1x CPU Share - \$0.05/dyno-hour; 2X, 1024MB RAM, 2x CPU Share - \$0.10/dyno-hour; Performance dynos, 6GB RAM, superior quality-of-service, low latency, high throughput - US\$ 0.80/dyno-hour

Free trial: Available

Google App Engine

Google App Engine, GAE or App Engine is a PaaS cloud computing platform to develop and deploy Web applications. It supports automatic scaling for applications. A fixed amount of computing resources are available for free usage.

Developer(s): Google

Initial release: 2008

Written in: Python, Java, Go, PHP

Licence: Proprietary

Website: <https://appengine.google.com/>

Supported technologies: Programming languages are Python, Go, PHP and Java; frameworks such as Struts, Spring, Django, Flask, web2py, CherryPy, Pyramid and webapp2

Features:

- Java Web application using a Java 7 JVM in a safe sandboxed environment
- Schema-less NoSQL datastore
- MySQL database in Google Cloud
- OAuth authentication
- Google-like searches over data

Offerings and pricing: Each Google App Engine application can use a fixed amount of computing resources for free. More details on pricing are available at <https://cloud.google.com/appengine/pricing>

Free trial: Available

Apprenda

The Apprenda PaaS defines a layer that sits below the application and acts as a host for your application. It manages network resources, and also provides an environment that allows applications to work as a service.

Developer(s): Matt Ammerman, Sinclair Schuller and Abraham Sultan

Initial release: 2007

Licence: Proprietary

Website: <http://apprenda.com/>

Supported technologies: .NET, Microsoft Azure, Windows Server, Team Foundation Server, SQL Server, Oracle Enterprise Database

Features:

- Service broker, API based transaction metering, distributed cache
- Federated authentication with enterprise systems
- Multi-tenant queues, entitlement definitions, application inventory, app deployment policies
- Infrastructure tagging, load distribution and high availability
- System centre integration

Offerings and pricing: Annual subscription based model. The annual subscription is calculated using the aggregate amount of RAM, in gigabytes, as reported by the host operating system running Apprenda.

Free trial: Available
