

Using object relational DBMSs to avoid writing SQL queries

ORM (object relational mapping) packages allow the user to create and access data in tables without writing SQL statements. A package that we will explore in this article is *peewee*, and we will look at some of its uses to get the work done using MySQL.

peewee provides the *MySQLDatabase* interface to create a connection to a MySQL database. As usual, it takes the database name as the first argument, and then the user name and password to make the connection.

```
>>> import peewee
>>> from peewee import *
>>> mysql_db = MySQLDatabase('test', user='user', passwd =
'pwd')
```

By deriving from the *peewee.Model* we can create the structure of the table that we desire and model it as a class. Instances of this can be saved as new records, and the class itself can act as the ORM mapper to provide other functionalities of filtering and querying, as shown below.

```
>>> class NewWorkData(peewee.Model):
...     date = peewee.CharField()
...     empname = peewee.CharField()
```

```
...     projname = peewee.CharField()
...     custname = peewee.CharField()
...     hours = peewee.IntegerField()
...
...     class Meta:
...         database = mysql_db
...
>>> NewWorkData.create_table()
>>> todaysdata = NewWorkData(date='11/05/15', empname='john', p
rojname='projectA',
custname='customerA', hours = 8)
>>> todaysdata.save()
1
>>> for data in NewWorkData.filter(projname='projectA'):
...     print data.hours
...
8
```
