

project root folder, and tasks which are meant to be run are specified in the *gulpfile.js* file. Elixir provides an easy way to integrate the *gulpfile.js* file with our Laravel application. To run Gulp, *nodejs* is the required dependency. If we check *gulpfile.js* just after a fresh installation of Laravel 5, it has the following function:

```
elixir(function(mix) {
  mix.less('app.less');
});
```

This means that we want to compile less on the given file, i.e., *app.less*. This *app.less* file can be found in the *less* folder inside the *resources/assets* folder. To compile the *app.less* file, open a terminal, reach out to the project folder and type the command *gulp*. Once it is compiled, we can get the *app.css* file inside the *public/css* folder. This *css* file is used to link to our *blade.php* page. If we don't want to run Gulp every time, just after the modifications are made to the file, use the *gulp watch* command.

Scheduler

This is an exciting feature improvement to simplify our

tasks. Instead of setting up *cron* jobs for each console command, which was necessary previously, only a single *cron* entry is needed to schedule your task. To run the job, the *cron* entry that needs to be added to our server is *php artisan schedule:run 1* and the scheduler will run it every minute. The command *schedule* is stored in the *app\Console\kernel.php* file, and within the same class we see the *schedule* method. Here is an example that will call the function every hour:

```
$shd->call(function () {
    // ...
});
```
