

Under the training wing, we primarily offer certification programmes in Red Hat Linux. These give employers ways to find and develop qualified professionals and help technical professionals prove their skills on Red Hat technologies. Being an authorised Red Hat Training partner for 12 years, we have been recognised as the best Red Hat training partner in Asia Pacific. With more than 25+ trainers, we offer the RHCSA, RHCE, RHCVA, RHCDS and the RHCA certification programmes.

Q What kind of engineering team is involved in the process?

Based on requirements for the projects, systems architects, analysts, developers, UI experts, testers, systems administrators, etc. are included in teams managed by project managers. We make use of the agile development methodology called Scrum.

Q Do you support the view that certifications help in fetching a job? Most of the companies I speak to consider certifications as just an add-on.

We are an authorised and loyal training partner of Red Hat since 2003. We have trained over 10,000 professionals who currently work in multinational companies in India and abroad. We anticipated the importance of Red Hat certifications in smoothening the rocky road for job-seekers very early.

IT certifications cannot be considered as just an add-on. They could be considered a 'decoration' to the bachelor's degree already possessed by a job-seeker. A certification differentiates an IT graduate from others during the recruitment process.

It has been widely reported that finding Linux talent is a major concern, since Linux is growing at such a rapid rate. Linux talent is being sought for at an unbelievable pace. When we supply trained and certified professionals to an organisation, we are basically supplying an industry-related ready workforce. This gives an edge to the hiring organisation. Their training costs become less and the employee can be easily assigned to new projects in minimal time. We make both parties happy—the job-seeker and the hiring organisation. The certification also helps employees get career advancements within the organisation.

Q What is the next step for a person getting an IT certification?

This would ideally depend on the interests of the individual. The candidates could either climb up the certification ladder or choose to advertise themselves in the job pool. The more the certifications achieved, the higher the chance of getting a job.

In the case of Red Hat certification, prospects can join in as junior systems administrators, for which they would be required to gather and update knowledge in areas like

“Enterprises are now describing open source as the core to their businesses, and the demand for expertise in open source technologies is mounting to whopping heights. On the Linux platform, the ‘cloud’ is the true winner. The reports from IDC point out that cloud computing will generate 2.3 million new jobs in India in 2015.”

virtualisation, the cloud and the like. This would, of course, be as per the requirement of the employer. Security administrator, data centre administrator and storage administrator are some of the other roles prospects could undertake from then on.

Q What are the avenues for a person getting certified in an open source technology domain?

Jobs are aplenty for people with the expertise in open source technologies. The person can work in data centres, internal server administration at airports, banks, universities, public parks, Web hosting companies, etc. The list is endless.

Q Do you see enough job avenues opening up for people trained with open source technologies in India?

Rapid growth in the use of open source technologies in IT firms and government entities has created thousands of new job opportunities for people who are trained in these technologies.

Not surprisingly, enterprises are now describing open source as the core to their businesses, and the demand for expertise in open source technologies is mounting to whopping heights. On the Linux platform, the ‘cloud’ is the true winner. The reports from IDC point out that cloud computing will generate 2.3 million new jobs in India in 2015. It is interesting to note that apart from cloud computing, allied services like server support, security, systems integration, the data centre, virtualisation, data storage, remote infrastructure management, IT transformation, etc. will be defining the global corporate, industrial and services sectors in the future.

Besides, governments and enterprises are increasingly undertaking transformation projects with new open source technologies. Mirroring these trends, without doubt, open source technologies are going to be the future, and IT professionals will soon acknowledge competencies in open source technologies as a career-advancing tool. Going forward, the IT sector is going to be flooded with opportunities in open source, not only in India but also around the world.
