

Figure 4: Widgets page

generated by running the following command:

```
$ rustdoc myworld.rs
```

When the command is run, a *doc* directory is created, by default, which will have a *myworld* directory containing HTML files. The *src* folder will have the file that contains the lines that we have written for generating the documentation. The Web pages generated by *rustdoc* are in the same logical hierarchy that is followed when writing a library. All the items like *struct* and *functions* will have a unique colour and when clicked on, you will be directed to their respective documentation.

Testing the documentation

In addition to support for documentation, *Rustdoc* also verifies the code examples that are included in the documentation. For that we just need to include the `--test` option while running the *rustdoc* command.

```
cptanu@A1rforce:~/myworld$ vim testing.rs
cptanu@A1rforce:~/myworld$ rustdoc --test testing.rs

running 1 test
test main_0 ... ok

test result: ok. 1 passed; 0 failed; 0 ignored; 0 measured
cptanu@A1rforce:~/myworld$
```

Figure 5: Results of using `--test`

```
rustdoc --test filename.rs
```

Rustdoc also provides few extra features that simplify some tedious documentation examples. If a line is prefixed with `#`, then that line will not show up in the HTML documentation but it will be used when testing the code block.
