

Voice blasting

Voice blasting is the method of calling a list of numbers and playing a pre-recorded message. The system will call each number, and if the call is established, it will play the pre-recorded message. The system also keeps track of the call status of the unsuccessful messages and tries a configured number repeatedly to deliver the message. Detailed reports of the complete status are provided.

Voice blasting with IVR is quite a popular technique for hot lead generation. The system will dial the customer and the IVR will ask if the client would, for example, like to buy a car. Upon getting a positive response, the IVR can ask about the client's budget. Based on the answers, the system can generate hot leads for various car manufacturers at different price ranges.

Voice logger

The conversation between the employee/agent and the customer may be recorded for the following purposes.

- **Quality monitoring:** The competence as well as communication skills of agents need to be checked from time to time.
- **Training:** The agents need to be trained based on the samples generated.
- **Spying:** Employees need to be monitored, to prevent them from passing on confidential information.

- **Successful calls:** Call centres need to keep track of the successful calls and pass on the voice recording to end customers for payment-settlement purposes.
- **Proof of transaction:** Call centres, like share broking agencies, need to keep recordings to have proof of transactions, in case of disputes later.

Voice logger software enables recording of conversations happening in the system, based on the configuration set. The recordings will also contain information about source, destination, time, disposition, etc. A graphical user interface (GUI) is normally provided with which users can filter the files required and listen, download or delete them.

Being a generic switching platform, multiple applications based on Asterisk are possible. Mark Spencer, the founder of Asterisk, has provided many generic interfaces to enable development of a series of applications. The community has gone ahead and developed all these applications, which helped Spencer realise his vision of revolutionising the telecom world with Asterisk. **END**
