

Ten Open Source Security Tools

With security breaches occurring as often as they do on the Internet, it pays to take precautions against identity theft, denial of service attacks, DNS poisoning, etc. This article takes the reader through ten popular open source security tools.

With the world moving towards the IoT, Web and infrastructure security have become a paramount concern. It is now critical to maintain a safe and reliable world, and we have to implement security in our systems, networks and devices.

Most of the major innovators in the industry like Facebook, Google and Netflix have been the frontrunners in developing security tools along with the open source community.

Security threats

The transition from closed networks to enterprise-wide IT networks is gathering speed but naturally raising the alarm about threats like viruses, spyware, adware, malware, rootkits, etc. These security threats can cause a wide range of disruptions, ranging from denial-of-service (DoS) attacks to identity theft, DNS poisoning, etc, on the Web.

There are a lot of open source tools available to

counter these threats so that your device is not at risk. Let's look at 10 open source tools that are widely used in the industry.

1. OSQuery

OSQuery is developed by Facebook and is a simple tool for your Linux and Mac OS X infrastructure. Some of the important features of this tool include file monitoring, hardware changes, process creation and network traffic. This tool allows easy access to data and also logs system information based upon your queries.

It allows users to write automation scripts, apply actionable information security intelligence, and discover new ways in which your enterprise can change servers.
