

Unotech Software awarded for its open source DMS solution

Unotech Software, a leading open source solutions and services provider, announced that it has received an award for the 'Best open source solution provider in business critical applications'.

The award was presented to Vikash Jha (co-founder, Unotech Software) at the 'e-gov BFSI Leadership Summit and Awards 2015' held at Mumbai this February. This summit highlights the fact that IT is one of the most important facilitators for

the transformation of the Indian banking, financial services and insurance (BFSI) industry. However, the biggest challenge and opportunity facing the Indian banking industry is how to use technology to reach out to the vast unbanked population and, at the same time, give a better and more user friendly experience. Hence, these awards are held to recognise the contribution of key organisations that are helping to successfully transform the implementation of IT in the banking and financial sectors.

Unotech Software has continually worked towards improving the quality of its solutions and services. First launched in 2012, its DMS (document management software) solution has significantly helped increase the productivity of the firm's clients, thanks to its help in digitisation and swift search of documents, improving workflow, creating a paperless environment, etc. "We are glad that our DMS solution has been recognised as the best in the BFSI industry. Our honest efforts to provide the best to our customers are starting to get recognition and it does feel special," said Jha. Unotech now plans to expand its market reach and keep helping the industry with its products and services—all based on open source.

HP delivers new technology and services portfolio

HP has announced a new portfolio designed specifically for the needs of service providers to create differentiated services, increase speed and agility, and drive business growth.

According to IDC, a majority of organisations will stop managing their own infrastructure over the next five years. Instead, they will make greater use of dedicated and shared cloud offerings in service provider data centres. To capitalise on these changes, service providers – Software as a Service, Infrastructure as a Service, telco/communication service providers, managed hosts and consumer service providers – need an efficient infrastructure that is highly scalable and supports business growth.

HP's new workload-optimised solutions, flexible business models and partnerships help service providers launch differentiated services faster in the market and stay competitive.

"Service providers must adjust to meet ever-increasing customer demands for simplicity, security and availability – they can no longer compete on cost alone," says Vikram K., director, Servers, HP India. "HP is delivering systems, built on open design principles, combined with services and solutions that allow service providers to move fast, launch new services and grow their business in a sustainable way," he adds.

Zentyal Server 4.1 launched

The Zentyal development team has announced the release of Zentyal Server 4.1, which aims at offering a Linux based server to businesses (with mail, a domain and directory, basic networking, a firewall and infrastructure), and can be set up in less than 30 minutes. It is supposedly both easy-to-use and affordable, offering full native Microsoft Outlook compatibility.

This release is completely focused on improving the stability and the feature set delivered by the OpenChange module, based on Ubuntu 14.04.2 LTS.

To migrate from Zentyal 4.0 to 4.1, users only need to upgrade the 4.0 installation to the last available packages once they are released, and a button will appear on the dashboard.

Zentyal Server comes with native Microsoft Exchange protocol implementation and Microsoft Active Directory interoperability. The 4.1 edition comes in two different flavours—the open development version (formerly known as the community edition) for bleeding edge testing of the latest available features, and a stable commercial version for production environments (fully tested and stable, quality-assured software updates and with commercial support).
