

The developers target ONOS to achieve 1 million flow operations per second and less than 100 ms (and ideally under 10 ms) of latency. The project reports that most of ONOS Blackbird's measurements meet these targets; the others will be optimised in future releases and in conjunction with use case and deployment requirements, the developers promise.

ONOS is perhaps the first open source SDN solution to achieve linear scale-out while maintaining high performance and availability. As the size of a network grows, ONOS instances can be added to scale the SDN control plane and seamlessly deliver the needed throughput. This ability not only breaks down barriers to real-world deployment but also future-proofs networks.

Here comes GNOME 3.16

The GNOME 3.16 update was announced on March 25, which definitely

is the best version yet.

Features include a new GNOME Shell theme, a revamped notification system, more useful notification pop-ups, overlay scrollbars for all GNOME applications, important usability

improvements for Nautilus (files), support for scroll wheel emulation in trackballs, NFS (Network File System) support in user space, Foursquare support, Wayland login screen and an updated Adwaita wallpaper.

Multiple core components have been updated, including Eye of GNOME, GTK+, Tracker, GNOME Maps, GNOME Music, GNOME Control Center, Videos, GNOME Terminal, GLib2, gdk-pixbuf, libsoup, Iagno, GNOME Documents, GNOME Photos, Evince, Calculator and Mutter.

Installing GNOME 3.16 is not something that can be done immediately. Users of other GNU/Linux operating systems need to wait patiently until the GNOME 3.16 packages arrive on the main software repositories of their distributions. This includes Fedora, the distro most associated with GNOME, which will use it in the next release, version 22.

Microsoft partners with Android manufacturers

Microsoft has announced its partnership with Android giant Samsung for

preinstalling its apps and services, like OneNote, Skype and OneDrive apps, on the new Samsung flagship brands, like the Galaxy S6 and Galaxy S6 Edge smartphones. Microsoft is doing everything it can to get Office into the hands of smartphone users, its priority being wider usage of Office.

The firm is letting cellular customers run Office on their telephones and tablets for free, in the hope of ultimately luring them to purchase premium options available via an Office subscription service.

Having seen how great the upcoming Windows 10 OS looks like, we're

Canonical partners with Ericsson for the Cloud System platform

Ubuntu developer Canonical has announced a three-year partnership with Ericsson—provider of communications technology and

services. Canonical is the lead commercial sponsor behind the open source Ubuntu Linux

operating system. Ericsson will use Ubuntu as the host operating system for the Ericsson Cloud System platform. Both Ericsson and Canonical are members of the OpenStack Foundation.

This collaboration will help both organisations respond to increasing demand from telecom companies and enterprises for more flexible, scalable options to meet the ever-growing appetite for new services.

Under the terms of the partnership, Ericsson will deploy Ubuntu as the host OS for Ericsson's Cloud System platform. Ubuntu Server OS will underpin Ericsson's offering for its telecommunications network, internal data centre and cloud computing customers; this will give users the choice and flexibility they've been waiting for and assist the global adoption of OpenStack based cloud technologies. Canonical views the Ericsson partnership as a strategic collaboration to bring the benefits of cloud, software-defined networking (SDN) and network-functions virtualisation (NFV) to the telecom and enterprise marketplaces.

The focus of OPNFV is to reduce the estate of hardware platforms in order to dramatically reduce operational expenses, reduce power usage, and create greater flexibility to grow or scale-down to better mitigate market volatility.
