

Panasonic to offer royalty-free IoT

Consumer electronics company Panasonic has announced that it will provide royalty-free access to software, patents and experience from its product ecosystem to speed up the development of the Internet of Things (IoT) software and services. The company plans to make available for royalty-free use mature and tested device-to-cloud software technology, currently employed in home monitoring systems, solar energy and in retail applications.

"As a well-respected member of the Alliance with deep experience in the IoT market, Panasonic is making a strong statement with this announcement. The power of IoT comes from the scale of the network of interconnecting things. The more things seamlessly connect using open protocols, the more individuals, businesses and communities can do. With this announcement, Panasonic is extending the reach and power of AllJoyn to deliver an Internet of Everything," said Philip DesAutels, PhD, senior director, IoT, AllSeen Alliance.

Panasonic will focus on expanding a secure, flexible and interoperable open source software framework to enable the development of scalable and reliable network services from a variety of components and systems including gateways and cloud services. The framework will support different IoT networking technologies, and new deployments as well as legacy systems.

bracing ourselves for what Windows Phone will bring us this year or the next. In the mean time, Microsoft is extending its reach as it looks to partner with Android manufacturers and place its software on devices.

This so-called 'freemium' approach to making money is the standard for countless app start-ups today.

The company really is pushing for cross-platform usage with its apps. This will lead to more visibility for Microsoft, a company that people thought would go down with the Windows platform. How different things now look, with a new perspective and a little effort on the part of Microsoft.

Ubuntu 15.04 available for download

Ubuntu 15.04 is available for download from Canonical, and comes with updates across the desktop, phone, cloud and IoT ecosystem. The latest release features a fully converged platform spanning the cloud, device and client.

This version of Ubuntu comes with products such as the Dell XPS 13 Developer Edition. It brings a host of improvements and enhancements designed to help cloud-focused businesses and developers design, deploy and manage successful cloud projects. It not only introduces new tools for cloud and IoT development, but also makes the desktop more productive with integrated menus and dashboard usability improvements.

With the new Ubuntu OpenStack Kilo, enterprises and telecom companies can experiment a great deal more with OpenStack. And Neutron has been updated to include Distributed Virtual Routing (DVR) to enable the former to scale more efficiently using multiple nodes. Ubuntu OpenStack also includes a new OpenStack nova driver for LXD—nova-compute-LXD, which allows end users to deploy workloads on OpenStack into containers, based on LXD. The advantages are high performance and density compared to KVM based workloads.

Support for ZeroMQ (0MQ) is also included with Ubuntu OpenStack via the Oslo messaging systems. 0MQ is a high-performance, asynchronous messaging library that does not require the use of a dedicated message broker. The aim of using 0MQ is to cut down messaging bottlenecks created at the messaging brokers in large scale deployments. The large organisations and service providers that Canonical works with require the highest levels of scalability, efficiency and flexibility from OpenStack.

As the Ubuntu 15.04 container features live migration of LXC containers between hosts, an improved security model for containers through AppArmor profiles and Docker updated to 1.5, developers run LXD on all the machines where they want to create and tear down container based workloads in this new Ubuntu container environment.

In Ubuntu OpenStack, the reference implementation of Cinder is based on Ceph where important updates have been made. It comes with the new version of Ceph Hammer ensuring a better performance via SSD. It also features improved performance of spinning disks via a front end SSD based cache. 'Snappy' which is expected to evolve in the coming years, is available in Ubuntu 15.04 for the first time. With Systemd as the default init system, Ubuntu 15.04 is available for download at www.ubuntu.com/download.

Alibaba joins Linaro Enterprise Group

Linaro, the collaborative engineering organisation that develops open source software for the ARM architecture, has announced that Alibaba has joined as a
