

Add the code snippet given below inside the *jp-type-playlist* div to create the graphical layout for the audio player. The GUI basically contains *Play* and *Stop* buttons to control the audio, *Next* and *Prev* buttons to traverse through the playlist, *Volume* controls to adjust the volume and a few more features like *Repeat*, *Shuffle* and *Toggle* to full screen. There is another button which helps the user to automatically generate the themes or colour schemes for the player. The code snippet for this will be explained in detail later in the article.

```
<div class="jp-gui">
  <div class="jp-video-play">
    <button class="jp-video-play-icon"
role="button" tabindex="0">play</button> </div>
  <div class="jp-interface">
    <div class="jp-progress">
      <div class="jp-seek-bar">
        <div class="jp-play-bar"></div>
      </div>
    </div>
    <div class="jp-current-time" role="timer" aria-
label="time">&nbsp;&nbsp;&nbsp;</div>
    <div class="jp-duration" role="timer" aria-
label="duration">&nbsp;&nbsp;&nbsp;</div>
    <div class="jp-details">
      <div class="jp-title" aria-
label="title">&nbsp;&nbsp;&nbsp;</div>
    </div>
    <div class="jp-controls-holder">
      <div class="jp-volume-controls">
        <button class="jp-mute" role="button"
tabindex="0">mute</button>
        <button class="jp-volume-max" role="button"
tabindex="0">max volume</button>
        <div class="jp-volume-bar">
          <div class="jp-volume-bar-value"></div>
        </div>
      </div>
      <div class="jp-controls">
        <button class="jp-previous" role="button"
tabindex="0">previous</button>
        <button class="jp-play" role="button"
tabindex="0">play</button>
        <button class="jp-stop" role="button"
tabindex="0">stop</button>
        <button class="jp-next" role="button"
tabindex="0">next</button>
      </div>
      <div class="jp-toggles">
        <button class="jp-repeat" role="button"
tabindex="0">repeat</button>
        <button class="jp-shuffle" role="button"
tabindex="0">shuffle</button>
```

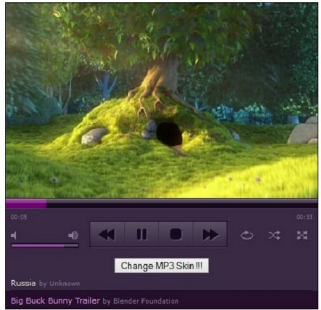

Figure 1: A screenshot of our jPlayer

```
<button class="jp-full-screen" role="button"
tabindex="0">full screen</button>
</div>
</div>
```

Apart from the controls mentioned above, the following lines of code also form part of the *jp-type-playlist* div:

```
<div class="jp-playlist">
  <ul><li></li></ul>
</div>
<div class="jp-no-solution">
<span>Update Required</span>
</div>
```

These lines of code are required to enlist a playlist of a few songs in the player (it is done by the following method, *Playlist.displayPlaylist()* which uses this unordered list), and also to give a message in case the audio player is not able to function properly.

Adding audio files

This step demonstrates the creation of a sample playlist using a few URLs and jPlayer support. All the tracks need to be added with the required details, and the *jPlayerPlaylist* adds them to the playlist. The built-in feature of jPlayer automatically highlights the current selection. The few options listed at the end of the script are meant for the user to further customise the player's functionality and appearance.

```
$(document).ready(function(){
  new jPlayerPlaylist({
```
