Linux fb6c47e05cfe 3.10.0-123.el7.x86_64 #1 SMP Mon Jun 30
12:09:22 UTC 2014 x86_64 x86_64 GNU/Linux
root@fb6c47e05cfe:/# ifconfig eth0 | grep inet
    inet addr:172.17.0.3 Bcast:0.0.0.0
Mask:255.255.0.0
root@fb6c47e05cfe:/#
```

Enter the IP address of the container (i.e., 172.17.0.3 in

this instance) in the browser and complete the other settings. Figure 1 shows the screen capture of the LAMP stack deployment in the container.

For building the custom Docker image using the base image, a recipe called Dockerfile is used. Shown below is the sample Dockerfile used to build the custom image with the LAMP stack:

```
FROM centos:6
MAINTAINER Teja <teja_ja@gmail.com>
#set the proxy
RUN export http_proxy=http://10.10.17.17:3128
RUN export https_proxy=http://10.10.17.17:3128
RUN export ftp_proxy=http://10.10.17.17:3128
#installing required packages
RUN rpm -Uvh http://dl.fedoraproject.org/pub/epel/6/x86_64/epel-release-6-8.noarch.rpm
RUN yum install -y python-pip && pip install "pip>1.4,<1.5" --upgrade
RUN pip install supervisor
RUN yum install -y openssl-server openssl-client
RUN yum install -y passwd httpd mysql mysql-server
RUN yum install -y php php-mysql php-devel php-gd php-pecl-memcache php-pspell php-snmp php-xmlrpc php-xml
# replacing my config file and starting required services
ADD ./supervisor.conf /etc/supervisord.conf
RUN service mysqld start
EXPOSE 22 80 3306
CMD ["/usr/bin/supervisord"]
```

Save the above contents to the file with the file name Dockerfile, and execute the command `docker build` for building the image. Once the build is successful, tag the image and save it with the command `docker build -t teja/lampStack`.

Once the image is built, the container can be started with the following command:

```
docker run -d -p 80:80 -p 3306:3306 -p 22:22 ushios/lamp-centos
```

Enter `http://localhost:80` in a browser to see the Web server running.
