

Continuous Integration

- **Yelp connects people with great local businesses.**
 - It uses Docker for next generation testing and service management infrastructure.
- **Benefits**
 - Isolation of dependencies
 - Rapid spin up of containers
 - Shorten development cycles
 - Increase testing speed
- **Rackspace's email service (MailGun)**
 - Mailgun has made significant investments in building a Docker-centric continuous integration system.
- **Benefits**
 - High-availability

Platform-as-a-Service (PaaS)

- **Baidu, Inc., Chinese-language Internet search provider**
 - As it helps to replace sandboxing with containerization
- **Benefits**
 - Multi-language, agile, and cost effective solution that provides flexibility to support number of frameworks and applications
- **Yandex is a European Internet company**
 - Uses Docker for infrastructure virtualization and application isolation
- **Benefits**
 - Efficient resource utilization
 - Security

Continuous Delivery

- **Cambridge Healthcare provides online access to health records and analytics**
 - They used single bare metal host running Docker and replaced several AWS AMIs.
- **Benefits**
 - Faster Jenkins-based continuous delivery pipeline.
- **Spotify streams music to more than 40 million users**
 - They used docker to accelerate continuous delivery process by leveraging Docker deployment.
- **Benefits**
 - Productivity gains within weeks of adoption

Application Related

- **Gilt Groupe, Inc., a leading online shopping company**
 - Uses Docker's platform to run all software applications which runs on a very modern micro services architecture
- **Benefits**
 - Isolated services
 - Easily manageable continuous delivery pipeline
 - Innovation and experimentation
- **Bleacher Report, a division of Turner Sports**
 - Uses Docker for its application lifecycle management
- **Benefits**
 - Scale, speed, and consistency
 - Serves 80 million visitors a month

Figure 4: Docker use cases

system kernel. One thing hypervisors can do that containers can't is use different operating systems or kernels. So, for example, you can use Amazon's public cloud or the VMware private cloud to run instances of both Windows Server 2012 and SUSE Linux Enterprise

Server in parallel. With Docker, containers must use the same operating system and kernel. On the other hand, if all you want to do is get the most server application instances running on the least amount of hardware, you don't need to worry about running multiple operating system VMs. If different copies of the same application are what you want, then it's better to consider containers.

Containers are smaller in size than VMs, the starting process is much faster and they have enhanced performance. However, this comes at the expense of less isolation and greater compatibility requirements due to sharing the host's kernel. Virtual machines have a full OS with their own device drivers, memory management, etc. Containers share the host's OS and are therefore lighter in weight. **END**
