

LibreOffice 5.0 comes with major performance changes

LibreOffice has been a great open source office suite for a long time now. The suite also has a version for Android. LibreOffice just released its latest version 5.0 for users. Unlike Microsoft Office or Apple's iWork, LibreOffice 5.0 is absolutely free. The latest version is faster and better than the previous ones. On the front-face, the latest version comes with several major interface changes. It still follows a retro office suite look. The real change is in terms of performance. It's much faster than previous versions. It can open and save files in the blink of an eye. There is tremendous performance enhancement while working with PDF files as well.

LibreOffice's spreadsheet application, Calc, is now compatible with Excel files. You can load an Excel file and edit it. However, not all functions are compatible with Excel functions. The new features are as polished and as fast as Microsoft's Excel and Google Sheets. Calc has new powerful conditional formatting and table addressing features. The latest version has simplified complex formulae and image cropping.

The latest version of Writer has also improved. You can now have experience a better word processing experience with Writer. The compatibility is also not an issue anymore. LibreOffice 5.0 is fairly compatible with Microsoft Word's documents. You can easily perform formatting and editing of Word documents using LibreOffice Writer. There are features to export and import from MS Office, PDF, RTF and more. Users can now time-stamp PDF documents.

The latest version is a necessary upgrade for current LibreOffice users. If you are a Microsoft Office or an iWork user, you should try this as an alternative.

to use the Moksha desktop, which we have forked from E17. Because it is built on the rock-solid foundation that E17 provides, even this first release of the Moksha desktop is stable and is something I feel comfortable using in a production environment," confirms Jeff Hoogland in a blog post.

While the Bodhi Linux 3.0.0 users won't be able to upgrade to the updated version directly, a list of changes and amendments has been released through the official announcement.

CentOS 6.7 now available for download

The latest version of CentOS is now available for download. Known as CentOS 6.7, the Linux OS is built upon the source code of Red Hat Linux. Besides the core components and graphical apps, the recently released operating system also comprises updates for the graphical desktop environment.

Regarding the specifications of the newest operating system, CentOS 6.7 has the updated LibreOffice 4.2.8.2 office suite, the ssd tool, support for udev rules, which is also utilised to safeguard the privacy of the user by restricting the mounting of removable media by making them read-only, and offering support for handling up to 240 virtual processors per virtual machine in the kernel based Virtual Machine hypervisor.

In addition to these, the operating system has a new package called Clufter, which converts older protocols like SSLv3 and cluster configuration formats.

Also, extra configuration options to multiple packages allow the user to choose the desired protocols. Vim has been updated to version 7.4, which has brought improvements to regular expressions and the *Undo* function.

"We are pleased to announce the immediate availability of CentOS Linux 6.7 and install media for i386 and x86_64 architectures," says the project lead of the CentOS Project. "Thanks to everyone who contributed towards making CentOS Linux 6.7, especially the effort put in, as always, by the QA and build teams."

CentOS 6.7 has upgraded Squid to version 3.1.23, which has apparently added support for HTTP/1.1 PUT and POST responses that have no message body, and has updated mdadm to version 3.3.2, which now has a better support for RAID level automatic array rebuilding and migrations.

KDE launches Plasma 5.4 with more fixes and features

KDE has recently launched Plasma 5.4 with a lot of fixes and features.

According to reports, the updated version might soon venture onto desktops. The KDE Plasma desktop has witnessed interesting improvements and amazing modifications, all of which have significantly changed the project.

Along with Frameworks and Applications, the Plasma desktop from KDE makes the UNIX product a great environment to work in.

The developers have been able to manage some unbelievable progress since the KDE Software Compilation was split into these three components. In fact, each version of Plasma has been a great success and it seems that there is a scope for more improvement in each edition. Plasma is usually the first thing a KDE user views, hence, the upgrade is clearly noticeable.
