

Zorin OS 10 Lite and Business Editions available for download

The Zorin OS developers have announced the availability of Zorin OS 10 Lite and Business Editions. Backed by Ubuntu 15.04 (Vivid Vervet) and built on the LXDE desktop environment, Zorin OS 10 Lite is meant for those who are new to Linux or own low-end machines with old hardware components, whereas, Zorin OS 10 Business Edition comprises the most advanced desktop applications along with tools for small or medium-sized business owners.

"We are pleased to announce the release of Zorin OS 10 Lite and Business. The former is the latest and greatest version of our operating system designed specifically for Linux newcomers using old or low-powered hardware; and Zorin OS 10 Business pairs the most advanced desktop software with powerful and extensive tools to help you run your business better," reads the official statement.

This announcement has come from Zorin developers one week after it launched Zorin OS 10 Core and Ultimate editions. With the perfect desktop theme,

Zorin developers call Zorin OS 10 Core as the most beautiful release yet. Based on Ubuntu 15.04, it comes with pre-installed Linux kernel 3.19 and happens to be its first major overhaul since Zorin OS 2.0

development, testing and production systems. You decide which support coverage is the best for each of your systems, individually, while keeping all of your systems up-to-date and secure.

Here comes Kubernetes v1.0

The Google Cloud Platform released version 1.0 of the Kubernetes project. Kubernetes is an open source platform for automating deployment, scaling, and the operation of application containers across clusters of hosts.

With Kubernetes, you are able to quickly and efficiently respond to customer demand. It helps you in scaling your applications on-the-fly, seamlessly roll out new features and optimise the use of your hardware by using only the resources you need. Kubernetes is lean, extensible, self-healing and portable. It works on the public, private and hybrid cloud.

The Kubernetes project was started by Google in 2014. Kubernetes builds upon a decade-and-a-half of experience that Google has with running production workloads at scale, combined with best-of-breed ideas and practices from the community.

Pixar Animation Studio's Universal Scene Description to be open-sourced

Pixar Animation Studios recently announced its intention to release its Universal Scene Description (USD) software as an open source project by summer 2016.

USD addresses the ever-growing need in the CG film and game industries for an effective way to describe, assemble, interchange, and

modify high-complexity virtual scenes between digital content creation tools employed by studios.

The open source Alembic project brought about standardisation of cached geometry interchanges to the VFX industry; with USD, Pixar hopes to build on Alembic's success, taking the next step of standardising the 'algebra' by which assets are aggregated and refined in-context. Says Guido Quaroni, VP of software R&D at Pixar, "One of the key aspects of Pixar's pipeline is the ability for hundreds of artists to operate simultaneously on the same collections of assets in different contexts, using separate 'layers' of data that are composited together at various production stages. USD generalises these concepts in an attempt to make them available to any DCC application."
