

Parse open-sources all of its SDKs

Parse, the back-end platform for apps on Facebook, which was acquired back in 2013 by the latter, recently announced that it will open source all of its software development kits (SDKs). Seeing the widespread success of Facebook's open source projects including React, Presto, HHVM, OSQuery, and RocksDB, Parse decided to open source all its iOS,

OS X, and Android SDKs. These SDKs are widely used by the mobile development community — in fact, Parse SDKs now power more than 800 million active app-device pairs per month.

Ubuntu based BQ Aquaris phones to reach India

Canonical is gradually reaching out to the world. After entering China, Europe and the United States with Ubuntu phones, it is now venturing into the Indian market. The new open source based mobile operating system which was introduced just six months ago, has reached various nations after it joined hands with smartphone manufacturers like Bq and Meizu. Now, the BQ Aquaris E4.5 and BQ Aquaris E5 phones are all set to make their debut in India.

While the operating system is still under development, it is successful in various regions. Ubuntu Touch could soon become a global phenomenon. While it is focusing on one region at a time, we hear that Ubuntu based phones would reach India by the end of this month.

“BQ will be launching the same two European devices, BQ Aquaris E4.5 and BQ Aquaris E5, with a black variant in India on the Snapdeal website. Two weeks after the launch, there will be an Ubuntu Store on Snapdeal where other Ubuntu products will be available. We haven't got a precise date for the launch, but it will happen probably in the next two weeks. For the Indian launch, Ubuntu Phone will not be released on devices with a specific Indian image but there will be specific content available from an Indian-specific app store.” Carla Sella posted on the blog.

India is definitely one of the biggest smartphone markets in the world. Hence, it will be interesting to see the performance of Ubuntu handsets in our country. While the Android operating system (OS) has already made its mark in India, tech buffs are eagerly awaiting another open source mobile operating system.

MDN recently celebrated its tenth birthday

Mozilla Developer Network (MDN) recently celebrated its tenth birthday. In February 2005, a few members formed a team which apparently negotiated with AOL to use Netscape DevEdge material and launched an open, community-built online resource for Web developers.

Mitchell Baker, CEO, Mozilla Foundation had made the announcement through a blog in the same month. However, on July 23, 2005 the original MDN wiki site was unveiled, which gradually grew and evolved. Currently, MDN has around four million users and 1000 volunteer editors, per month, who create and translate documentation, sample code, create tutorials along with other learning resources for all open Web technologies including HTML, CSS and JavaScript, which has made the open Web rich as well as handy.

As of now, the resource comprises 34,500 documents with 13,200 pages in English and 21,200 translations in 42 locales. With an aim to inspire ideas and encourage collaboration, MDN provides useful explanations for coding practices to a huge base of Web developers ranging from hobbyists to full-time professionals.
