

```

def __init__(self):
    super(ImageViewer, self).__init__()
    self.imageLabel = QLabel()
    self.imageLabel.setSizePolicy(QSizePolicy.Ignored,
QSizePolicy.Ignored)
    self.imageLabel.setScaledContents(True)
    self.setCentralWidget(self.imageLabel)
    self.setWindowTitle("Image Viewer")
    self.resize(500,400)

def event(self,e):
    if (e.type() == QEvent.Gesture):
        return self.gestureEvent(e)
    return super(QMainWindow,self).event(e)

def gestureEvent(self,event):
    pinch = event.gesture(Qt.PinchGesture)
    if pinch:
        self.pinchTriggered(pinch)
    return True

def pinchTriggered(self,gesture):
    self.scaleImage(gesture.scaleFactor())

def open(self):
    fileName, _ = QFileDialog.getOpenFileName(self, "Open
File",
        QDir.currentPath())
    if fileName:
        image = QImage(fileName)

```

```

        self.imageLabel.setPixmap(QPixmap.
fromImage(image))
        self.scaleFactor = 1.0

    def scaleImage(self, factor):
        self.scaleFactor *= factor
        self.imageLabel.resize(self.scaleFactor * self.
imageLabel.pixmap().size())

if __name__ == '__main__':
    import sys
    app = QApplication(sys.argv)
    imageView = ImageViewer()
    imageView.show()
    imageView.open()
    imageView.scaleImage(imageViewer.scaleFactor)
    imageView.grabGesture(Qt.PinchGesture)
    sys.exit(app.exec_())

```

The widget needs to grab a gesture for it to be delivered. You need to override the event function and add code to handle the gesture events. In order to keep things simple, only one gesture was used in the above example. You can find a more comprehensive C++ example, called *imagegestures*, included in the *qt5-qtbase-examples* package.
