

FWBACKUPS – Back up Files with Ease

Here's a free-to-download, free-to-use, feature-rich user backup program that allows you to back up your documents any time and anywhere. It is also cross platform. It has a powerful yet easy-to-use UI. In short, fwbackups keeps your data safe and secure.

Data backup and security is one of the fastest emerging fields in computer science. It's always been of great concern to those who are dealing with important data. That's where backup software comes in handy. It stores your important files in a secured server. The files can be encrypted and compressed, which ensures protection from unauthorised access.

Fwbackups is an open source backup software which allows users to back up documents any time. Fwbackups was developed by Stewart Adam. It is a feature-rich program that is completely free to download. It also has no restrictions on trials or usage. It provides a unique and simple user interface. Fwbackups also enables you to back up documents to a remote computer, so that you don't have to worry about losing the data. The support for scheduled backups is a great new feature which automatically backs up the documents according to the time specified by the user.

Features

Fwbackups is a feature-rich software that comes with a lot of user friendly options.

- **Cross platform support** - fwbackups supports Linux, Mac OS X and Windows. Its multi-platform support allows users to restore files from other machines that run on different operating systems.
- **A simple interface** – A simple and powerful interface enables backups with ease.
- **Scheduled backups** - This feature allows the user to schedule the backup for a specified time and date.
- **Remote backup** - fwbackups can back up files to any

remote computer using the SSH file transfer protocol (SFTP) in a secured connection. It also enables the backup of files to removable media like a USB drive.

- **Intelligent backup** - fwbackups makes the backups faster by copying only the changes since the last backup, with incremental backup modes.
- **One-time backup** – This feature allows performing a backup at once. It is also supported by remote backup, whereby the backup can be made to a remote server.
- **Log viewer** - This shows who has authorised access to fwbackups, apart from other backup operations, errors that occurred, etc.
- **Backup formats** - Different backup formats include archive (tar), compressed archive (tar.gz) or exact copy of the files (using rsync).
- **Excluding files or folders** – This enables you to get some extra space on your hard disk by backing up files that you don't need.
- **Organising backups** - fwbackups removes the expired backups and lets you restore backups from a list of backup files.
- **Free software** - fwbackups is free software, published under the terms of the GNU General Public License. It is not only free to use, but also to redistribute or to modify its source code as long as the user provides the same freedoms to the modified version.

Installing fwbackups

Fwbackups runs on Windows, Linux and Mac OS X. In order
