

Figure 4: Django's 'It worked' screen

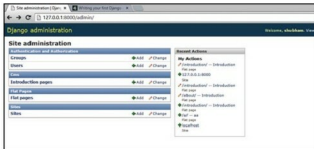

Figure 5: `models.py` file

Figure 6: Django admin's home page for cmsApp

August 04, 2015 - 12:16:15

Django version 1.8.2, using settings 'cmsApp.settings'
Starting development server at <http://127.0.0.1:8000/>
Quit the server with CTRL-BREAK.

Open the link <http://127.0.0.1:8000/> in your Web browser and you should see the screen shown in Figure 4:

A CMS application

Creating a simple CMS application is one of the most common tasks in Web development. It allows users to edit and create dynamic Web pages.

1. Issue the command `python manage.py startapp CMS` to create a CMS application in your project. Open `settings.py` and add `CMS` to the `INSTALLED_APPS` variable.
2. Open `models.py` which is in your CMS application folder with a text editor and add the following code:

```
class IntroductionPage(models.Model):
    title=models.CharField(max_length=100)
    body=models.TextField()
    time=models.DateTimeField()
```

3. Now create tables for our CMS application by issuing the command `python manage.py syncdb` to get the following output:

```
$ manage.py syncdb
```

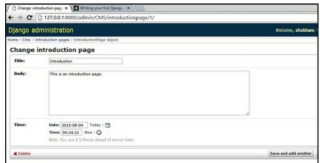

Figure 7: Adding content to the page

```
c:\Python27\lib\site-packages\django\core\management\
commands\syncdb.py:24: RemovedInDjango19Warning: The syncdb
command will be removed in Django 1.9
  warnings.warn("The syncdb command will be removed in Django
1.9", RemovedInDjango19Warning)
```

Operations to perform:

Synchronize unmigrated apps: staticfiles, messages
Apply all migrations: sessions, admin, sites, flatpages,
contenttypes, auth, CMS

Synchronizing apps without migrations:

Creating tables...
Running deferred SQL...
Installing custom SQL...

Running migrations:

Rendering model states... DONE
Applying CMS.0001_initial... OK

4. Now the application needs to instruct Django which model should be shown for editing. Open `models.py` of the CMS application and add the following line at the beginning of the script:

```
import django.contrib import admin
```

5. Now add following line at the end of `models.py`:

```
admin.site.register(IntroductionPage)
```

The modified `models.py` will look like what's shown in Figure 5:

6. Now run the server by issuing the command `manage.py runserver` and enter your login credentials to see the screen shown in Figure 6'.

7. Add contents to the page by clicking on 'Add' on the introduction page.

8. Now we need to create a client-side template for our application.

Create an HTML file archive in `cmsApp/CMS/templates/` `archive.html` and add the following code to it:

```
{% for content in contents %}
```
