

Figure 8: Screenshot for 127.0.0.1:8000/introductionpage/

```
<h2>{{content.title}}</h2>
<p>{{content.body}}</p>
{% endfor %}
```

9. Now to create a view function in our CMS app's `views.py` file, use the following code.

```
from django.template import loader, Context
from django.http import HttpResponseRedirect
from cmsApp.CMS.models import IntroductionPage
```

```
def archive(request):
    contents= IntroductionPage.objects.all()
    t=loader.get_template("archive.html")
    c= Context({'contents':contents})
    return HttpResponseRedirect(c)
```

10. The next step is to map the task to the URL. Open the

`urls.py` of the project, add the following line of code to catch any requests that begin with `introductionpage/` and pass them to `urlConf`.

```
url(r'^introductionpage/', include('CMS.urls')),
```

Now create a `urls.py` file in the CMS folder and add the following lines of code:

```
from django.conf.urls import url
from . import views
urlpatterns = [
    url(r'^$', views.archive, name='archive'),
]
```

11. Open <http://127.0.0.1:8000/introductionpage/>
