}

```

Figure 5: Delete display

and password are provided. In my case, neo4j is my username and NMS the password for the neo4j database server. The neo4j database is active on port 7474, thus the URL in the code is `jdbc:neo4j://localhost:7474/`. The code for addition, deletion, viewing and updating is available in NodeManipulation as shown in Figure 4.

In the 'Add node' method the uniqueID is an auto-generated value which acts as the primary key for the label. The Hashmap named policyMap contains the values that are stored as the property of the node like PolicyName, Cron Text, Location, etc. In the update statement, the where clause is used and the node with the specific policy ID is updated using the SET command.

The node can be deleted using the 'Delete' command, whereas the 'Return' command is used to display the nodes. You can learn how to perform more complex operations on the neo4j site.

I must end by saying that the future is graph databases as we can easily find answers to complex questions like, "Has Kabir ever worked with Salman or known anyone that has worked with him?" within seconds. **END** 🐼
