

Ten Must-Have Open Source Tools for Backup and Recovery

This is a list of 10 open source backup and recovery tools that the author believes are the most useful. We suggest that the reader tries out a few of them.

Backup and recovery are integral part of any datacenter these days. With the current data explosion, the need for an efficient backup/recovery solution has become critical.

The open source world offers its own solutions in this space and provides data archiving/backup solutions for efficient performance, while ensuring cost savings.

How open source tools help a data centre

Open source tools have many advantages in the data centre environment. First and foremost is their low cost and the flexibility they provide. Also, being open source, everyone will be aware of the source code so any enhancements that need to be done have a greater chance of getting implemented, quickly.

Most open source projects have a lot of contributors. And

being FOSS, systems administrators can always customise the code to suit their data centre needs.

Ten FOSS backup tools

1. AMANDA

AMANDA stands for Advanced Maryland Automatic Network Disk Archiver. It is a simple backup solution that allows the IT administrator to set up a single master backup server to back up multiple hosts over the network to media, which could range from tapes to hard disk drives.

AMANDA uses native utilities and formats and can back up a large number of servers and workstations running multiple versions of Linux or UNIX. It uses a native Windows client to back up Microsoft Windows desktops and servers.
