Figure 3: Click to change your CPU frequency

on the amount of RAM on your system, and how fast a processor you have, you might want to undo this later—if so, just return to *Startup Applications*, select the entry you'd created, and click *Remove*.

Note: The *OpenOffice Quickstarter* leaves an icon in your panel. You can close the Quickstarter at any time by clicking the icon and choosing the *Exit* option. You especially need to do this if you've just installed a new plug-in, and must restart OOo; exit both OOo and Quickstarter, then restart them, so your new plug-in will work.

Additionally, if you have a lot of RAM on your system (modern computers come with 2 to 4 GB of RAM) then you can increase the memory reserved for OpenOffice, to a maximum of 256 MB. Visit *Tools > Options* in any OOo component; select the *Memory* option on the left. Type in 128 or 256 in the *Use for Openoffice.org* entry. Click *OK* and see the difference in OOo's performance.

Control your CPU speed with the scaling applet

To use a car analogy, your processor operates in various 'gears', depending on the workload of your system. You can manually put your processor into 'top gear', and your computer performs heavy tasks faster. To do this, right-click the top panel, and select *Add to Panel*. From the list of applets, select and add the *CPU Frequency Scaling Monitor* applet.

Right-click the applet and choose *Preferences*. Choose which processor or core (listed as CPU0 and CPU1 on a dual-core system, for example) you wish the applet to monitor.
