

TIPS & TRICKS

Remove packages and not their dependencies

To remove only a package and not its dependencies on an RPM-based distro, you need to run the following command:

```
#rpm -e --nodebs
```

This will remove the package while retaining its dependencies.

Move your mouse's cursor with the keyboard

Follow the command below to move your mouse cursor using your keyboard instead of your mouse.

Just press 'Alt+Shift+Num Lock' on your keyboard and start using number pad keys to move the mouse cursor. To deactivate this function, press 'Alt+Shift+Num Lock' once again.

Converting man pages to a printable text file

To convert man pages of various Linux commands into a printable text file, use the following command:

```
$man foo | col -b > foo.mantxt
```

...where 'foo' is the command name and 'foo.mantxt' is the resulting text file. This text file can now be printed.

Remembering deleted text in Vi

In case you want to perform the cut-and-paste function at several places in your file, the Vi text editor provides an easy method to name a buffer to perform this task. We'll look at an example to understand this. Let's suppose you have a file 'MyFile.txt' with the following content:

```
---MyFile.txt---
Sun           //Line1
Moon          //Line2
Stars         //Line3
Planets       //Line4
Clouds        //Line5
---MyFile.txt---
```

Now, suppose I want to cut Line2 and paste it after Line3. In Vi, I can use the double quote (") operator to name the 'cut' command buffers. For example, in the above case, go to Line2, and then type "cdd to save Line2 with the name 'c'. (dd is used to delete the current line).

Now, we can paste the deleted line by typing "cp. So, simply go to Line3 and type "cp. Line2 will be pasted after Line3 as follows:

```
---MyFile.txt---
Sun           //Line1
Stars         //Line3
Moon          //Line2
Planets       //Line4
Clouds        //Line5
---MyFile.txt---
```

Downloading video streams with MPlayer

Saving a video stream is easy in GNU/Linux. All you need to do is install MPlayer (if not installed, already). To install it on a distro with Yum as the package manager, run the command given below:

```
#yum install mplayer
```

Now, get the link of the streaming video and execute the following command in the terminal:

```
#mplayer -dumpstream http://myvedio.com/vedio.avi -dumpfile myVedio.avi
```
