

```

root@linuxtest:~
[root@linuxtest ~]# /opt/likewise/bin/domainjoin-cli join likewise.example.com Administrator
Joining to AD Domain:   likewise.example.com
With Computer DNS Name: likewise.example.com

copfsadmin@LIKewise.EXAMPLE.COM's password:
SUCCESS
[root@linuxtest ~]#

```

Figure 3: Joining AD via the GUI tool

There is also a GUI utility available, named *domainjoin-gui*. It is not packaged in the Likewise installer; you need to download it separately from the Likewise site, and install it. This utility (see Figure 3) makes it even easier to join the AD—who says services in Linux are tough to configure?

Logging in on the desktop with AD credentials

Once you've got the Linux system to join the AD domain, you can authenticate yourself to the system with your AD credentials. You can log in to an X session with an AD user account like *DOMAINusername* (for example, *likewisedemo.example.com/Administrator*) and can also SSH to the box. An example of an SSH command would be:

```
ssh likewise.example.com/Administrator@linuxtest.likewise.example.com
```

Note: *linuxtest.likewise.example.com* is the FQDN for the host (Linux desktop) on which you have installed Likewise. You can also use the IP address of the host, instead of the FQDN.

Now don't you agree it's simple to integrate Linux with AD, using Likewise? Installing, joining the domain and authenticating with AD credentials are all really simple procedures. So I would love to share some more useful information about Likewise with you—read on!

Troubleshooting the Likewise agent

To troubleshoot the agent, you can check which of the following services are running, with the command:

```
ps -of | grep -i likewise.
```

You can start, stop, or restart services with the command:

```
/etc/init.d/<service name> <action>
```

...where *action* is one of *start*, *stop* or *restart*.

Issasd: the Likewise security and authentication subsystem, which forms the core of the Likewise identity service.

dcerpcd: the DCE/RPC daemon that handles communication between Linux and MS Active Directory.

netlogond: this daemon detects the optimal domain controller and global catalogue, and caches the data. (A global catalogue provides a central repository of domain information for the forest; it stores partial replicas of all domain directory partitions.)

eventlogd: the logging service for local and remote computers.

lwiod: the Likewise input-output service.

srvsvc: the server and workstation RPC services.

Configuring the agent

There are several configuration files installed by the Likewise agent in the */etc/likewise* folder. Some of the important ones are *lsassd.conf* (for the *lsassd* daemon), *netlogon.conf* (for the *netlogond* daemon—the single entry here sets the expiration of the cached information about the optimal domain controller and global catalogue) and *eventlogd.conf*.

The *lsassd.conf* file is the primary configuration file for Likewise. Whenever you change the file, remember to make the Likewise daemon reload its configuration by either restarting *lsassd*, or by executing */opt/likewise/bin/lw-refresh-configuration*. Now let's look at some useful settings.

password-lifespan: specifies when the machine account password is reset in AD, if the account is not used. The default is 30 days. To change it to 60 days, for instance, edit the setting to: *password-lifespan = 60d*.

skeleton-dirs: by default, */etc/skel* is copied to every new user's home directory. You can specify that Likewise should use another directory for skeleton files, with *skeleton-dirs = /etc/example*.

login-shell-template: lets you change the default shell for new users. For example, *login-shell-template = /bin/bash*.

Other points to note

When a system joins a domain, Likewise creates two local user accounts: *machine-name/Administrator* and *machine-name/Guest*. You can view information about these accounts by executing the following command:

```
/opt/likewise/bin/lw-enum-users.
```

The Likewise *domainjoin-cli* tool includes many modules/actions that you can use to configure services and
