

components, which I've had reason to use, including: *leave* (deletes the machine account in AD), *stop* (stops Likewise daemons), *start*, *hostname* (sets the computer hostname), *krb5* (configures *krb5.conf*), *nsswitch* (enables or disables the Likewise *nsswitch* module), *pam* (configures *pam.d* and *pam.conf*), *ssh* (configures *sshd*) and *bash* (fixes the Bash prompt for backslashes in usernames).

To disable a module (for example, PAM), run the following command:

```
domainjoin-cli join --disable pam Likewise.example.com Administrator
```

This will disable the PAM module, which means that you will no longer be authenticated through it.

Likewise has many functions and commands that are outside the scope of this document; for more information, check the Likewise documentation at http://www.likewise.com/resources/documentation_library/.

Once running, I've found Likewise Open to be very stable, but in the rare event that something goes wrong, it's often enough to just restart the *lsassd* daemon. If you're still getting errors, it might be worth checking the forums for help: <http://www.likewise.com/community/index.php/forums/>.

Likewise Enterprise has many advanced features, like group policies (Enterprise even includes around 500 default

group policies). It provides a Likewise Administrative Console that you can use to manage AD records from Linux. Further, it supports AD-based settings and restrictions for Linux desktops, enabling the implementation of strict security policies.

Nevertheless, Likewise Open is still a very powerful and handy tool for Linux-AD integration, offering the same centralised, platform-independent user management functionality as a combination of Samba, Kerberos, PAM and NSS. It's far easier to implement Likewise than to set these up manually!

If you enjoy using Likewise Open, and feel your organisation needs the greater features of Enterprise, it will probably be worth a look. I prefer using open source software because of the freedom it offers, including the freedom to explore. However, let me note that I've now also wound up exploring MS Active Directory!
