

Figure 1: Authentication Configuration

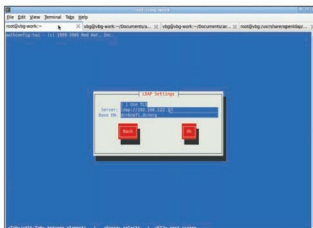

Figure 2: LDAP Settings

To create an LDIF containing user and password attributes (for `/etc/passwd` and `/etc/shadow`, respectively), execute the following scripts: `migrate_base.pl` and `migrate_passwd.pl`.

```
[root@vbg ~]# cd /usr/share/ldap2migration/
[root@vbg migration]# ./migrate_base.pl
```

```
dn: dc=knafli,dc=org
dc: knafli
objectClass: top
objectClass: domain
```

```
dn: ou=Hosts,dc=knafli,dc=org
ou: Hosts
objectClass: top
objectClass: organizationalUnit
```

```
dn: ou=People,dc=knafli,dc=org
ou: People
objectClass: top
objectClass: organizationalUnit
```

```
dn: ou=Group,dc=knafli,dc=org
ou: Group
```

```
objectClass: top
objectClass: organizationalUnit
```

You can store this output in a file:

```
[root@vbg migration]# ./migrate_base.pl > /tmp/base.ldif
Then run the migrate_passwd script:
```

```
[root@vbg migration]# ./migrate_passwd.pl /etc/passwd /tmp/users.ldif
```

Let us see the record for the user vbg:

```
[root@vbg migration]# cat /tmp/users.ldif | grep -A 20 "dn: uid=vbg"
dn: uid=vbg,ou=People,dc=knafli,dc=org
uid: vbg
cn: vbg
objectClass: account
objectClass: posixAccount
objectClass: top
objectClass: shadowAccount
userPassword: {crypt}$1$6XtM.ui$gdu3RH2yf34uWvLxE.1
shadowLastChange: 14662
shadowMax: 99999
shadowWarning: 7
loginShell: /bin/bash
```

Finding your IT infrastructure costs too steep?
Want to optimise every paisa of your IT budget &
also experience "superior performance"
Want to Migrate to an open source-based IT setup...
...where you will have more say?
