

LG Optimus One lands in India

The LG Optimus One is an Android-powered smart-phone with OS version 2.2. It offers smoother Internet browsing, Web-page loading, application pop-ups, multi-tasking and 40 pre-loaded apps. The phone has a 3 MP camera, 2 GB of memory, GPRS, EDGE, threaded messages and many more special features. It is now available at Rs 13,500.

World's first Android TV

Swedish TV maker, People of Lava, has launched a new TV called 'Scandinavia', which runs the rather dated Android 1.5 (Cupcake). Claimed to be the world's first Android TV, Scandinavia comes with a remote control that has a built-in keyboard. The TV allows you to do almost everything that you can do with a smart-phone, except make a voice call.

Scandinavia's home menu features widgets for Google Chrome, Facebook, YouTube and Google Maps. Besides, the set offers an application store for users to download additional content. "There are only 20 or so apps in the store at the moment, but there will be more than 1,000 before the year-end, as it will be able to import many of the apps in the online Android Market store, as long as they are scalable to fit a TV screen rather than a handset," said Martin Ljunggren, marketing director of People of Lava.

Its top-of-the-line 139.7-cm (55-inch) model is now available in Sweden for \$5,820 (or 40,000 Swedish Krona). However, customers in the US and UK markets will have to wait until next year to acquire this Android TV.

Official photos of Jolibook now out

Following unofficial reports at the end of last month, Jolicloud has now released (through Flickr) official press shots of its new netbook computer called Jolibook. The Jolibook runs version 1.1 of the company's Jolicloud OS, and comes preloaded with the Chromium Web browser,

Facebook support, Spotify, the VLC media player, Skype and a number of other applications.

The little laptop features an Atom N550 processor (Intel's latest dual-core CPU aimed at netbooks), and a 250 GB hard drive.

Lenovo's LePad tablet to hit US market next year

Lenovo's Android-based tablet PC, LePad, the development of which had been announced in July, is all set to be released in the US next year. Yang Yuanqing, CEO of Lenovo, has also confirmed this news; however, no price details have been furnished so far. Its US launch is likely to give tough competition to recently released tablets from Apple, Samsung, Dell and RIM. In addition to LePad, Lenovo has several tablet designs under development – the IdeaPad U1, a Windows laptop with a detachable touch-screen that functions as a standalone Linux tablet, is one of them.

Dell launches 3G Android phones in India

Dell has brought two Android-based smart-phones—the XCD28 and the XCD35—to the Indian market. Priced at Rs 10,999 and 16,990 respectively, the phones will support 3G for high-speed connectivity, Wi-Fi and Bluetooth. "In the fast-growing Indian mobile market, this will allow more and more of the younger generation and mobile professionals to access a rich browsing and multimedia experience, backed with the assurance of an uncompromising, market-leading service support. We chose to launch the new XCD range of smart-phones first in India, to offer a complete portfolio of Dell mobile Internet products in all screen sizes," said Mahesh Bhalla, general manager (consumer and SMB), Dell India. While XCD28 will be immediately available in the market, you can lay your hands on the XCD35 only next month.

Panasonic to launch Android smart-phones in Japan next year

After pulling out of the overseas mobile phone markets in 2006, Panasonic is now planning a comeback with its new Android-powered smart-phones next year, to grab a share of the booming market. Featuring networking capabilities with other Panasonic products, the smart-phones will hit the Japanese market early next year, followed by a re-entry into overseas markets in 2012.

"We misjudged the speed at which smart-phones would be taken up in the Japanese market," said Osamu Waki, head of Panasonic's mobile communications division. The Japanese consumer electronics giant may be late to the smart-phone party, but Waki stated, "With the rapid shift to Android, we want to catch up quickly."
