

## Android 2.3 soon to be available on Nexus One

Gingerbread will indeed be Android 2.3, and the updated OS will soon be carried by Nexus One, announced Alvaro Fuentes Vasquez, member of the leadership team at the Open Handset Alliance (OHA), recently, via Twitter. Even though it wasn't confirmed by Google, the OHA apparently has no reason to be lying about this. Gingerbread is expected to include an improved design, rather than just deliver a slew of new features for the mobile OS.

## 'Lovelock' picked as Fedora 15 release name

The Fedora community has chosen 'Lovelock' as the release name for Fedora 15. "The voting has concluded for the Fedora 15 release name, and the results are in! 'Thank you' to the Fedora community members who made name suggestions and participated in the voting," the developers noted. Fedora 15 is likely to see a final release in approximately six months' time. The vote was fairly evenly divided between the top five choices of Lovelock, Asturias, Blarney, Sturgis and Pushcart, with Lovelock beating Asturias with 729 votes compared to 701.

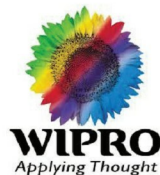

## Over 300 defects in Android OS

Research carried out by Coverity, a software quality firm, reveals that the central kernel of the Android mobile operating system has many defects. Of the 359 flaws detected in the study, 88 of them were categorised to be of high risk—i.e., they can cause a security breach, or crash a device running the operating system, particularly Froyo. The research encompassed several open source projects like Linux, Apache and PHP. Half the flaws found were termed to be of high risk. However, the report pronounced that in spite of these vulnerabilities, Android is still more secure compared to its counterparts.

## openSUSE 11.1 to reach end of life on December 31

The openSUSE Project developers have announced that after December 31, 2010, no new updates will be available for version 11.1 of their popular Linux distribution. openSUSE 11.1, the first release built entirely in the openSUSE Build Service, was announced in December 2008.

## Wipro, Actuate to drive BIRT adoption in India

Actuate Corporation, the open source business intelligence vendor with expertise in BIRT (Business Intelligence Reporting Tools), has formed an alliance with Wipro Infotech. Under the agreement, Wipro Infotech will promote the use of Actuate products, including Actuate BIRT, among organisations in India. The new alliance will allow Actuate to leverage Wipro's market presence to support the growing number of BIRT enterprise deployments, as well as BIRT developers, in India—to address selling

opportunities and increase overall awareness in the Indian market for open source based solutions.

## Mozilla Labs' F1 service

Mozilla Labs has released a new browser extension experiment called 'F1', to help users share links across a variety of social networks and services. The developers have initially implemented support for Facebook, Twitter and Gmail, because they are popular services and have what company sources claim are "...good API support for authorisation using OAuth, and in the case of Gmail, provide APIs to contacts, which makes for a good auto-complete experience."

Once installed, the F1 adds a button to the Firefox toolbar, which lets users specify which accounts they want to use for sharing. After initial set-up, users click the toolbar button, select how they want to share the link, add a message, and hit Share all without having to sign into and out of their various accounts each time.

## Yahoo! Mail Android app revamped

Yahoo! has released an updated Yahoo! Mail Android app with added features like the ability to support multiple Yahoo! Mail accounts within the app, browse photos, sync contacts, and chat with friends. Using the Android app, users will be able to preview photo attachments right in the Inbox. If Yahoo! Messenger is installed on your device, it will work in tandem with the Yahoo! Mail app.

It now becomes easy to see online messenger contacts from the mail app, view their details, and start IM conversations and video calls. Further, the updated app allows users to easily sync the contacts on their phone with their mail contacts. It also features spam reduction, and allows users to update their Twitter and Facebook statuses from within their Inbox.
