

Figure 6: Screenshot showing Forms with fields of table 'empdetail'

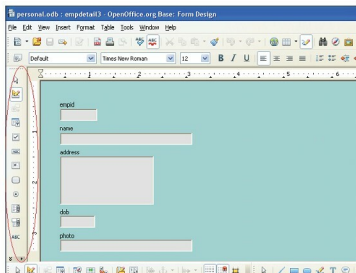

Figure 7: Form 'empdetail' opened in design mode with the toolbox under the red circle

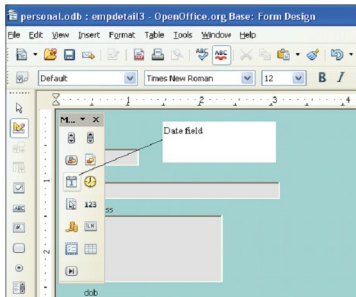

Figure 8: Draw date-field from toolbox to form

We will change the *dob* field's widget from a *textbox* to a *datefield*, as shown in Figure 8. Click the *More controls* icon in the toolbox, and select the date-field. Click on the form, and draw the control by dragging the mouse pointer. To adjust

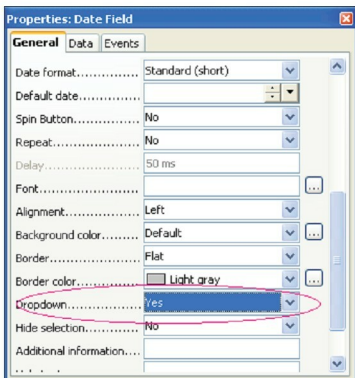

Figure 9: Properties window of the date-field

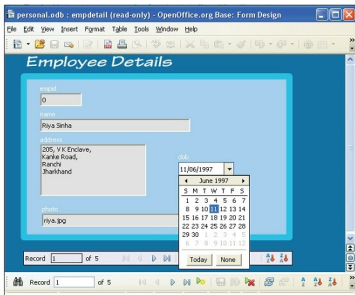

Figure 10: Calendar bound to date-field to enter date of birth

the new widget to make data entry more user-friendly and include a drop-down calendar, double-click the date field, and you will get a *Properties* window, as shown in Figure 9.

Select the *General* tab, and change the *Dropdown* property to *Yes*, as shown in Figure 9. Also set the *Default date* to 1/1/1960, to help in selecting the workers' date of birth. Next, choose the *Data* tab, and from the drop-down menu of the date, choose *dob* as the field. This will bind the *dob* field of our table to the new control on the form. We now almost have our final form for data entry. After making some ornamental adjustments, my form looks like what's shown in Figure 10. Save the form and reopen it by double clicking it. Observe that to enter the date, you just click the field for a drop-down calendar and choose the desired date.
