

Figure 15: Query window with two tables selected and relationship established

a simple query to list all the names of the workers, along with the hours worked by them. Click the *Queries* icon in the database window, and then *Create query in design view*. This will open a *Query Design* window, as shown in Figure 15. In the *Add Table or Query* window, in turn, double-click the *empdetail* and *hrsbooking* tables to add them to the query. Click the *empid* field of *empdetail* and drag it to the *empid* field of *hrsbooking* to set up a one-to-many 'join' between the two tables. Now select the fields that you want to view (tick the *Visible* checkbox for each) and click the *Run query* icon. You should see results similar to Figure 16.

The beauty of using queries is that forms can also use a query instead of a table as the data source for the form. There are a number of different possibilities in designing queries. **END**

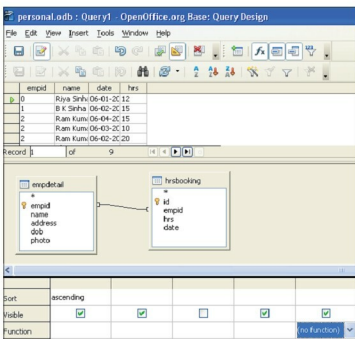

Figure 16: The query window, after you click on the 'run query' icon
