Interoperable open source clouds for NASA and Japan

NASA CTO Chris Kemp demonstrated interoperability between NASA's Nebula cloud and Japan's NII (National Institute of Informatics) cloud, in a first step to sharing resources for the benefit of the international science community. The demonstration used both clouds to serve selections of the Mars Orbiter data sets to a Web application. Both NASA's Nebula and NII's cloud are built entirely from open source components with open data APIs. The two organisations plan to collaborate on open source reference implementations of interoperable cloud services in the hope of accelerating the development of cloud standards and the adoption of cloud infrastructure services by the scientific community. SCO vs Linux: Case closed!

In the case between the SCO Group and Novell, Judge Ted Stewart has ruled that the jury in the previous trial got it right, and the UNIX copyrights were never sold to SCO.

In a previous trial in 2007, Judge Dale Kimball had ruled that Novell owned the copyrights. SCO appealed this ruling and asked for a jury trial, which was granted. The jury verdict was that copyrights were not transferred when Novell sold its UNIX business to SCO in 1995. According to Groklaw, the judge's remarks are quite unequivocal and leave SCO no room to manoeuvre.

HP buys Phoenix's HyperSpace quick-start Linux

BIOS and firmware specialist, Phoenix Technologies, has now sold its HyperSpace division to PC market leader HP for \$12 million. HyperSpace is said to stand out from other available quick-start operating systems because it can use Intel processors' virtualisation functions to run simultaneously with the main operating system. Phipps leads change at Open Source Initiative

Simon Phipps, recently elected OSI board member, has been asked by the board to create a group to develop a new member-led governance charter for the organisation. In a blog posting, Phipps said: "Change is now inevitable because the board recently passed rules imposing term limits to make room for new blood."

Phipps feels that the OSI should widen its scope to address issues such as open data, open cloud computing and consumer awareness of open source and the four freedoms. He also wants to see expanded resources to help governments and NGOs adopt open source. Phipps is looking for "...smart, informed people with a heart for software freedom" to be involved in the development of the draft and details. More at: <http://bit.ly/PhippsSimon>

15 years of PHP

On the 8th of June, 1995, Rasmus Lerdorf launched PHP with a post to the comp.infosystems.www.authoring.cgi Usenet news group that announced version 1.0 of his 'Personal Home Page Tools'. Lerdorf made the tools available as open source code (originally under the GPL, and since version 4.0, under the PHP Licence) and PHP has since found a wide audience. Read some interesting history at: <http://bit.ly/15yearsPHP>

digiKam 1.3.0 out

Version 1.3.0 of the open source advanced digital photo management application introduces several revisions to database support, including a new database interface; MySQL and SQLite are now supported. Other changes include the ability to rename files according to database values; and the QueueManager can now apply an image watermark over a photo. The developers have also released version 1.3.0 of the Kipi plug-ins (essentially a bug fix release) that adds support for captions export. More at: <http://bit.ly/digiKam>

HSQldb / HyperSQL 2.0 released

The developers of the '100 per cent Java' database, HSQldb, have announced HyperSQL 2.0, with a new core, improved scalability, query optimisation, stored procedures, new data types and support for SQL:2003-SQL:2008 core features. The new version has a fully multi-threaded core with two-phase locking and multi-version concurrency control. Support for multi-gigabyte BLOBs (Binary Large Objects) allows for storage of up to 64 TB of data. Large query result-sets can now be stored on disk as they are generated.
