

"Linux news. Real-time"

Linux Today

www.linuxtoday.com

Just one word: Updated hourly. Okay, that's two words. And that's *Linux Today* for you. With its rolling list of articles, there's bound to be something that you like. Personal experiences with FOSS, distro reviews, hardware reviews, application reviews, industry trends and code politics, *Linux Today* is a smorgasbord of news stories. Its front page may have as many as 40 stories at one go, and interesting ones, at that. This website features some original articles, as well as collected stories from around the Web.

So, is this a news collection site like Tuxmachines? No, since Tuxmachines mostly collects from 'amateur' blogs and such non-pro media, while *Linux Today* mostly collects stories from other mainstream or pro media.

Linux Today

Linux Today is pro-FOSS, not pro-Open Source or pro-Free Software. It is passionate about FOSS adoption. Its famous editor has been vocal in her support of small, FOSS-friendly hardware vendors against giants like Dell, which are perceived as less dynamic in providing FOSS-installed hardware. Check out its recent review of a small vendor, ZaReason's, FOSS-loaded netbook. A pretty gutsy stance, if ever there was one.

A buffet well worth tucking into daily.

"Simply historic"

Slashdot Linux

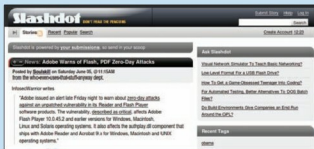

http://linux.slashdot.org

/. is definitely a big paragraph in the Internet's history. The ultimate geek blog linking to stories on information technology, Slashdot has a Linux section sharing in the general glory. If your company, project or article gets a mention on Slashdot, do two things: (a) gloat, for you've made it, and (b) get bandwidth (and lots of it), for your Web server is likely to soon crash from all that increased site traffic (the name for it is the 'Slashdot Effect').

Yessir, Slashdot's Linux page covers stories that affect the Linux ecosystem, from Google's Android and zero-day vulnerabilities in the Flash plugin, to newly tested open source tablets, GNU GPL court sagas and the SCO case. Slashdot Linux looks at game-changing trends that define tomorrow's FOSS.

Slashdot carries no in-house articles, just linked stories. The best part is, these stories are voted up the page through a user ballot. Just imagine tomorrow's newspapers and magazines working in that way—it would keep journoes on their toes!

Yet, Slashdot goes beyond news collection. Its reader

Slashdot Linux

comments alone often make for great reading. Slashdot readers can pose technical problems that other readers answer. We're talking hundreds of comments, occasionally even thousands, on a single story.

Slashdot is very anti-Bill Gates, and does not maintain a separate Windows page. It has a MAD-magazine-style tagging system for its stories. It also has a separate page for BSD.

Because of Slashdot's focus and ballot system, its Linux or BSD page is updated quite a few times daily, only not in bulk—it carries ten stories at any given time. It's worth checking out at least a couple of times a week. Slashdot started in 1997 and with 5.5 million uses a month (for the whole site), it truly is a phenomenon.
