

“Linux ka mela!”

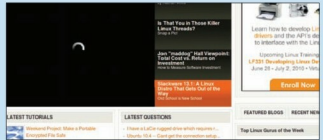

Linux.com

www.linux.com

The Linux Foundation owns the Linux.com domain (d'oh!). But this wasn't always the case. From its birth in 1999, Linux.com was held by various companies, and before its current avatar, it was a FOSS journalism site, and a prestigious one at that. These days, it is a general portal, with information, contacts, products and services. Call it a bazaar or *Linux ka mela*, with linked articles, application and distro reviews, a FOSS directory, and also a forum where geeks present themselves and are rated.

Linux.com links you to content more often than it produces it. Here are a few sections: Software, Hardware, Community Blogs, Distro Blogs, Gurus, Embedded/Mobile. Phew. Where's the soft drink stand?

What's a bazaar without buzz? Or in this case, clutter. This is one cluttered website, but in a pleasant way. It is even video-enabled—video tutorials anybody?

Linux.com

FOSS projects are also featured on Linux.com. It is more for power-users than newbies—the latter could lose their way here, or on the other hand, could find something and settle right in.

By the way, if you like Linux.com, why not check out the *Linux Journal* website (linuxjournal.com)? *Linux Journal* is the original Linux magazine (not owned by the Linux Foundation) and is perfect for intermediate to expert FOSSers. Of particular interest are its projects, which involve intriguing programming or tweaking.

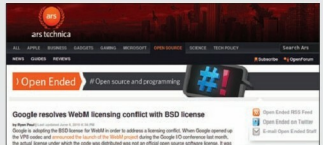

“The art of writing on technology”

Ars Technica

http://arstechnica.com/open-source

Let us note that its name means ‘Art of Technology’ in Latin. A prestigious IT journalism website, it covers both industry news and technical reviews. It can be read for free and is fuelled by ads, like many others in this list.

The Ars (pronounced ‘arz’) is noted for its depth in reporting and sobriety in tone. Its articles may be opinionated, but they are logical and cool—more information than entertainment. When Technica covers something, it invariably throws the kitchen sink at it. Consider its 10-page review of Ubuntu 10.04. Every new feature is covered... Every single one. Read this, and you'll never have to read any other review on 10.04, ever.

Ars Technica

Ars was launched in 1998, and is currently owned by Conde Nast publications, which also owns *New Yorker*, *Wired*, and *Vogue* magazine, among others. The quality of the thinking, writing and the diligence in software reviewing is exquisite, and quite possibly the highest there is in the FOSS world.

The website is more for industry and technical professionals than for casual readers or newbies. Certainly a mind-improving read, this.

The others

You may also like linuxworld.com, linuxplanet.com and tuxradar.com, which are quality websites but didn't quite make this list. This is a personal list, and makes no claim to being definitive.
