

KNOW HOW

Q I have got the KDE 4.3 CD from *LINUX For You* magazine. You have done a great job by compiling this CD. I'd also like to make a similar CD with my own choice of software. I am trying to set up a desktop from SUSE Studio. I need some help for this; will you please guide me?

First, I want to know what patterns need to be selected to get a basic operating system to function? Second, what are the packages to be added to get the ultimate multimedia experience? I am waiting for an encouraging reply from you.

—*kedarinath, prabhakedar@gmail.com*

With SUSE Studio you can build a KDE 4.4 distro in just a few minutes. All you need is an account to log in at SUSE Studio and follow the steps below:

- After logging in to your home page in SUSE Studio, click the 'Create new appliance' button and select the openSUSE 11.2

KDE 4 Desktop template as the base system. Select the architecture (32- or 64-bit) and give a name to your distro. Click the 'Create appliance' button. You'll land in the main window where you can select the software for your appliance.

- Go to the software tab, click on 'Add repositories', search for 'KDE4', and then add the repository 'KDE:KDE4:Factory:Desktop openSUSE_11.2'. Also add the repository 'Packman Repo' and 'Multimedia', as this will provide some of the multimedia software that you require for your appliance.
- Go back to the software selection, and remove the pattern 'kde4'. Search for 'KDE 4.4', and add the pattern 'KDE 4.4 Default Desktop'.
- Make changes as per your requirements. For example, you can upload a wallpaper of your choice or select some of your favourite software. Here you can add packages like Xine, VLC, Flash, SMplayer, Lame, kdenlive, Avidemux, etc, to build the appliance with multimedia support. (All these should be automatically pulled from Packman Repo, which you have already added.)
- After you are done with all the selection and configuration, click on the 'Build' tab. Wait for some time and your appliance is ready.

Q I just want to know which edition of *LFY* did the Fedora 11 source code appear in. I have tried searching the Web but did not succeed. Can you please help me search for the source code?

—*Chintan Dave, chintan_gaurav8@yahoo.com*

You can download the source RPMs from:

<http://fedora.inode.at/fedora/linux/releases/11/Fedora/source/SRPMS/>

Q I have installed Squid on a CentOS 5.3 server but it is not working. Please let me know how to resolve the issue.

—*Ankit Aggarwal, Lucknow*

With the information that you have provided, I would recommend that you start Squid in verbose mode and check for errors. To start Squid in verbose mode, run the following command:

```
/usr/local/squid/sbin/squid -D -d 3
```

Q I am new to the world of Linux and need your help. I have been working on the terminal for the past few days and facing a problem in finding the size of the directory/file. I tried searching the Internet for a solution and found that the *du* command is the solution for it. The option *-sh* gave me the output in human readable format. How can I find the largest file or sub-directory in the current directory?

—*Krishna Vasishta, Gurgaon*

You can try the command given below after changing the directory:

```
du -k | sort -nr | more
```

Here, the *du* command with the *-k* option will list all directories and their sizes in kilobytes. The *sort* command sorts the output of *du* so that the largest directory is shown first in the list. **END**
