

LifeSpring Hospitals Information Management System

Zimbra Mail box

Innumerable merits

After zeroing in on the open source infrastructure, there has been no looking back for LifeSpring. This cost-effective IT infrastructure will allow it to seamlessly scale up its operations while continuing to capture valuable customer feedback and information.

A future-proof platform

Open source guarantees great scalability, complementing the growth plans of an ambitious organisation like LifeSpring. Enterprise-class open source solutions have helped LifeSpring Hospitals leverage its IT resources to strategically build the right platform for tomorrow. "Today, we have about 150 concurrent users on LDAP, the learning management system and other open source applications in our infrastructure. Looking ahead, LifeSpring plans to grow exponentially, and we are confident of the same information catering to our growing technology needs in the future," says Kumar.

A perfect fit for mission-critical applications

LifeSpring Hospitals has achieved great stability with respect to the mission-critical applications on its open source infrastructure. It currently runs three mission-critical applications: the lightweight directory access protocol (LDAP), voice over internet protocol (VoIP) and hospital information management system (HIMS), on the open source platform. "LDAP, though a background application for most users, is very critical, as it is

Open Source Trouble Ticketing System

integrated with all the open source applications including our mailing solution, LMS and HIMS. Similarly, VoIP is vital for smooth information flow between our customers, hospitals and our two customer-facing call centres. Our HIMS is also instrumental for the day-to-day functioning of every hospital unit.

"Nearly a year after implementing the open source platform, we haven't had any performance issues. Not an hour of productivity has been lost, in terms of system downtime, ever since we implemented the solution," says Kumar. The response time is critical to a system (like VoIP and HIMS) that is partly exposed to end customers, as any performance delay would adversely affect the end customers' confidence. "The Enterprise Linux Platform ensures that the response time is less than a second over WAN links," vouches Kumar.

Cost advantage

Open source technology has helped LifeSpring Hospitals achieve cost efficiency at various levels through quicker decision making, reduced total cost of ownership and reduced people costs. "LifeSpring Hospitals provides maternity healthcare at one-third the price of private hospitals, no more than Rs. 4,000 per patient, for a normal delivery in our general ward. The cost-effective nature of open source, which we adopted in 2009, has allowed us to pass those benefits to our customers, thereby providing affordable healthcare," says Kumar.

Time is money

The open source-based HIMS and VoIP system have resulted in quicker decision-making. Like in every business,
