

Figure 4: Customised version of CINT with an additional C++ class

If you examine the directory listing now, you will see various additional source and object files created by *makecint*. To build the customised interpreter, run *make*. To test your new and custom version of CINT, run *testmycint.cpp* (shown below, as well as in the archives) with *./mycint testmycint.cpp*.

```
int main() {
    cMakeCintDemo cMCT1, cMCT2(7);
    cMCT2.getState();
}
```

Do you see how the external functionality is now included in the code interpreter itself? The output of this customised

interpreter is shown in Figure 4.

This was just a basic demonstration of these tools. Explore the man pages and the samples provided in the sources, and you could use these great programs in so many innovative ways, only limited by your imagination. C and C++ code interpreters provide a big productivity boost. They are very helpful while learning C and C++, for quick prototyping and for experimentation. EIC and CINT go beyond just C and C++ code interpretation with the features we've already seen. These code interpreters can make C and C++ development more productive, flexible and an enjoyable activity. **END** 🐼

Inviting FOSS experts to write articles on their area of interest

LFY covers a myriad of topics—network management, software development, embedded systems, community issues, and even hands-on guide for newbies. If you've got an interesting topic, let us know. Thanks to the launch of linuxforu.com we are now trying to extend our content portfolio related to Linux & Open Source.

To know more on how to become an LFY author, contact us at lfyedit@efyindia.com

Few topics that top our list:

- ♦ Tips 'n' Tricks for software developers or IT implementers
- ♦ Cool tweaks for FOSS enthusiasts
- ♦ FOSS on mobile
- ♦ Virtualisation (Implementation)
- ♦ OpenJDK or Java on Linux
- ♦ OpenSolaris (software development)
- ♦ How can I do 'that' on Linux
- ♦ Reviews of latest open source projects & tools
