

KNOW HOW

Q I have been working as a systems administrator for the past four years and have been a regular reader of *LFY*. I need some help with our organisation's Zimbra Mailserver installation (Open Source Edition). There are about 200 employees in our firm and all of them have individual e-mail IDs. My Zimbra installation is working successfully. But I don't know how to back up and restore my installation. Please help me to configure the back-up and restore functions. I did search the Web but could not find a solution.

— **Somasdaram S, ssomu86@gmail.com**

There is a lot of information available on the Net that explains the procedure for back-ups. You can try the steps shown at the following link: ([http://wiki.zimbra.com/wiki/Backing_up_and_restoring_Zimbra_\(Open_Source_Version\)](http://wiki.zimbra.com/wiki/Backing_up_and_restoring_Zimbra_(Open_Source_Version)))

Do remember to follow each step carefully, or you may end up damaging your installation. Hope this helps.

Q I am trying to schedule a command to run at a specified time, for which I have tried the following procedure:

```
at -f <command> -v <time>
```

But it shows an error. What should I do? Please advise me.
—**aarshstlati1989@yahoo.co.in**

With the `-f` option, you need to specify the file name from where the jobs should be read. Please try the following steps to schedule your task:

```
#at <time>
```

...then press *Enter* (the time should be entered in the 'hhmm' format)

You will get the 'at' prompt, where you can type the command and exit.

Please go through the man pages of the 'at' command for more info.

Q I have been reading *LFY* for the last three months. I wanted to know if it is possible to rebuild Firefox from the source code. I have installed Fedora. Do I have the source code on my system?

— **Vishesh Goel, Meerut**

Yes, you can do that. There are a few hardware and software pre-requisites for rebuilding Firefox. You need to have a system with at least 1 GB of disk space, 512 MB of RAM, and lots of available swap space. Detailed documentation can be found at https://developer.mozilla.org/En/Developer_Guide.

However, to build on the Fedora system you need to have a few tools installed. You can install them by running the following:

```
yum install cxx zip gcc-c++ glib2-devel gtk2-devel fontconfig-devel \
libnotify-devel libXEE-devel alsa-lib-devel libXt-devel freetype-devel \
pkgconfig-devel glib-devel curl-devel autoconf213.xorg-x11-proto-devel \
libX11-devel libXau-devel libXext-devel wireless-tools-devel glibc-static
```

For a few of these you will need to add the RPMForge repo on Fedora.

You can download the source from: https://developer.mozilla.org/En/Developer_Guide/Source_Code/Downloading_Source_Archives.

Q I want to configure my system so that the mails for the root are sent to my Gmail ID. I have tried searching the Web for details on how to do this but I am unable to configure my system the way I want to. Can you please help me?

—**Somasdaram S, ssomu86@gmail.com**

If you have a mail server installed on your Linux box, you can send the root's e-mail to the Gmail ID by making the following changes. Open the `/etc/aliases` in any text editor and add the following line. Do remember to do this as the root user.

```
root: <your_gmail_id@gmail.com>
```

Now save this and close the file. After saving the changes, you need to run the following command:

```
#newaliases
```

This will update the alias database. Now you can test it by sending an e-mail to the root.

Note: Do remember to check your Spam folder in Gmail for the mail, as there are high chances that e-mails generated from your local computer will be treated as spam by Gmail. **END**
