

Write Your Next Program on Linux

Quite a few colleges and schools still teach C/C++/Java programming on Windows—and even worse, on DOS (using Turbo C/C++)! GNU/Linux provides a first class operating system, replete with support for dozens of different programming languages, besides outstanding support for C, C++ and Java. And not only is it free of cost, but it comes with the freedom to modify, share, and extend the IDEs and toolchains! So why on earth do people continue to use outdated and painfully inefficient operating systems or developer tools? This article dispels the myth that Linux is 'difficult', and shows how simple it is to get started with programming on Linux!

*T*hrough this article, I want to ask people to start programming on the GNU/Linux operating system (from here on, referred to as just 'Linux'). Students who are just getting started in programming; educators who teach or have a role in teaching programming to new students; hobbyists who program on Windows—I'm asking all of you to please read on and give

Linux a real good try for at least a week. If you agree that programming on Linux is indeed a better experience than your previous platform, then stay with it, and enjoy the freedom that the rest of us do!

Just to clear any misunderstandings, I am not aiming to get you to write code for the Linux kernel itself (though that could well follow as your comfort and programming proficiency
