

The Architect and His Role

In this article, the authors examine the roles of a solutions architect and software architect from different view points. How will the architect shape the product's outcome? Should the architect have a fair knowledge about the business aspects of the firm creating the product? What are the different roles of an architect in a service and a product organisation? By describing the contents of an architecture document, the authors enumerate the responsibilities of an architect.

Architects create useful new products or features from scratch, or add to an existing system. They transform abstract concepts into tangible realities, using established principles of science, engineering, software and hardware development.

The three most important terms related to

architecture used by engineers and scientists alike, are *domain*, *technology* and *software*. Let's consider each of these.

If you comprehend only software, you could be called a software consultant. You could be a specialist in C or in Object Oriented Programming languages like C++ or Ruby, with a knowledge of software configuration management.
