

A Simple Standards-based

Slideshow System

S5 is a slide-show system for browsers that lets you run presentations like those in MS PowerPoint or OpenOffice.org Impress without a dedicated application—you just need a Javascript-capable browser, and you're ready to go, no matter what operating system you're using. This article shows you how to use this impressive system.

Whenever I wanted to put up a series of tips and tricks on my blog, or even highlight some important points to my friends via my website, I would be at a loss. Making an online presentation out of a blog, or designing a whole new system, is too tedious. So I always created image slide shows for this purpose—until I came across S5, which changed everything.

Anyone with a working knowledge of HTML, CSS and a bit of Javascript can create their own presentations using S5. If you have substantial CSS knowledge, you can easily

create new and eye-catching themes for your presentations as well.

S5 features all the usual keystroke/mouse shortcuts, such as the left/right arrow for the previous/next slide; a mouse click for the next slide; page up/down keys, etc. This improves usability a lot, compared to less worthy Web presentation systems that require you to click buttons to navigate slides.

Getting started with S5

For a person new to coding, creating S5 presentations might seem a bit intimidating at first. This tutorial is meant to help with
