into different parts, like those you can see in Figure 4 (three parts). This tool operates on the video and audio clips together. Deleting portions of the clip created by the scissors is simple; just select the part you want to delete, and click the delete tool (trash-can icon). You can also drag the portion of the clip to the trash-can icon to delete it. The last button, *Ungroup*, lets you separate the audio and video parts so that you can edit each independently. Select the portion of the clip that you want to ungroup, and click the *Ungroup* button. The *Group* button is the second-last; to join audio and video parts, select both and click the *Group* button.

Linking arbitrary clips together: Suppose you have two cut parts and want to link them together, use the *Link Together* button (the fourth one).

Breaking clips: If you want the clips not to be linked together, so that they work according to their individual needs, select the clips and click on the *Break Clip* button (the third one). You can preview the results of your editing by clicking the *Play* button, as mentioned earlier.

When it's time to make a final package of your work, use the *Render project* toolbar button. Provide a name and output location for your video, and click OK. Click the *Modify* button to enter the *Export settings* dialogue box, as

Figure 4: Cut the clips into parts

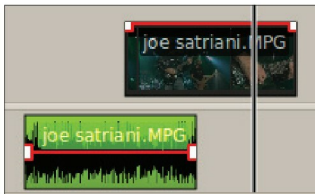

Figure 5: Separate audio and video

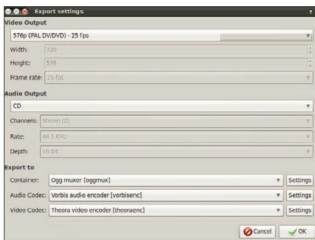

Figure 6: Pre-rendering Export Settings

shown in Figure 6.

Choose the video output from the options listed—720p, 1080, etc, which lets you make an HD video too. Next, choose your audio output, and then move to the format. The *Container* part will amaze you with the large number of supported formats. Select the appropriate audio and video codecs, click OK, and then render. Enjoy your newly-created video! **END**
