Scheme is developed by Per Bothner and distributed as part of the GNU Operating System by the Free Software Foundation.

Opening the Blocks Editor

Note: I have placed information on the set-up in boxes, rather than mixing it in here. Please refer to the boxes 'Platform and set-up with FreeRunner' and 'Reconnecting the phone to App Inventor' for that information.

Figure 5 is a screen capture of the Blocks Editor with the MoleMash tutorial open. To open it, click the *Open Blocks Editor* button in the AIA Web application. The browser asks you what to do with the *.jnlp* file you are downloading. Choose to run it with Java Web Start, then wait while the application is downloaded.

Note: For those on data-capped connections, the Blocks Editor downloads every time you open it. If you have problems getting it to communicate with the phone, sometimes you need to close it and re-open it. If you had NoScript enabled in Firefox, where you are running the AIA Web application, Blocks Editor complains that it is unable to get 'project information'; you have to close Blocks Editor, disable NoScript, restart Firefox, open App Inventor and your project, and re-launch the Blocks Editor. Why am I mentioning this? From a quick test with Gkrellm's data-transfer monitoring, the data transferred (both ways) while opening the Blocks Editor is around 3.8+ MB. Multiply that by a few times a day, and it's something to keep in mind if you're close to your data cap on your Net connection, or paying per MB of transferred data.

Once the Blocks Editor's Java Web Start application is downloaded, you should see a prompt asking you whether you want to run the application; click *Run*. After the Blocks Editor starts up, it sometimes fails to retrieve the open project information from the browser. The note above tells you about Firefox with NoScript—but if you don't use NoScript and still have this problem, then try (with the Blocks Editor remaining open) clicking *My Projects* in the AIA Web application, and
