

```
real=192.168.0.110:80 gate
real=192.168.0.128:80 gate
service=http
request="test.html"
receive="Still alive"
scheduler=wlc
protocol=tcp
checktype=negotiate
```

Ldirectord will connect to each real server in certain intervals of a few seconds, and request `192.168.0.110:80/test.html`. It will be added again, once the check succeeds.

Test

Start *Ldirectord* and check the real server table:

```
/etc/init.d/ldirectord start
Starting ldirectord... success
```

Disable the *Ldirectord* service

Make sure *Ldirectord* is not running, and won't start on boot. Only *heartbeat2* will be allowed to start and stop the service.

```
/etc/init.d/ldirectord stop
/sbin/chkconfig ldirectord off
```

Although Linux Virtual Server and other Linux systems are feature-rich and capable of attaining parameters like scalability and availability, there are features being added every day, and can be sustained at the same module where load balancing is done. The idea behind adding these features can be to provide an ideal solution for all Web issues that an organisation encounters—that too, at a minimal cost.

Some of the extra features that are, or can be, added to a Linux load balancer (or, say, an ideal load balancer) are:

SSL accelerator: As we know, SSL traffic takes a considerable time to process, so an accelerator can be included.

Asymmetric load balancing: This can be configured in case one server is to be assigned more load than the others.

Authentication: Users can be authenticated through a variety of authentication sources, before allowing them to go through. 

By: Afaaq Imran and Ashish Sharma

Ashish Sharma is a CSE graduate from JUIT, currently working at Ericsson in the CA-OSS team. A technology enthusiast, he is a writing freak and has a couple of blogs, and a Linux website-cum-blog at <http://tuxcrux.com>. You can reach him at sanskriver@gmail.com.

Afaaq Imran did his MS in the UK, and works at Ericsson for LTE Integration. His interests are computers, programming, gadgets and jail-breaking. You can reach him at afaqimran@gmail.com.

Best way to learn Linux Device Drivers

Core skills like kernel programming or Linux device drivers should be learned at a slow and steady pace for fully comprehending it, says Mr. Raghu Bharadwaj, a lead trainer on core programming. Unlike normal application software learning where it is mostly restricted to functionality based learning, system programming involves deep understanding and analysis of issues like the Linux kernel and its subsystems. Your options to learn these skills are classroom based training, learning through experience, self learning through trial and error and through an effective online course.

While all other modes of training has its own merits and demerits, online learning is definitely a step ahead, especially for courses like this. Online courses gives you the comfort of accessing it 24x7 and lets you learn things during hours of focus and interest. Another important aspect is that it permits you to go through each session any number of times and fully understand each and every topic effectively.

Mr. Raghu Bharadwaj is a lead trainer at Veda Solutions, you can listen to his **training videos** on Linux kernel and device drivers at www.techveda.org Advt.
