

- Its external memory slot is expandable up to 32 GB.
- Both 3G and Wi-Fi connectivity supported.
- Battery life is rated at 7 hours of continuous video playback.

The Galaxy Tab has an edge over all other Android tablets since it is Google certified, which enables users to access the ever-expanding Android market for games and apps. Along with this, users will also be welcomed with Samsung's pet projects—the MusicHub, the ReaderHub and the MediaHub. The MediaHub is an online TV and movie store for renting and buying video; the ReaderHub is for buying and reading e-books; and the MusicHub for purchasing music.

Android-based tablets have been cropping up from all across the globe, but the Galaxy Tab looks the most intriguing. A comparison to the iPad is definitely on the cards. And based on its specs, the Galaxy Tab certainly looks like a worthy challenger.

Mozilla promotes browser-based games

Mozilla Labs has announced a new project called Mozilla Labs Gaming to encourage game developers to create innovative games for the Web. The developers say that the project is "...all about games built, delivered and played on the Open Web and the browser. We want to explore the wider set of technologies which make immersive gaming on the Open Web possible."

Discussing the announcement, Pascal Finette, director, Mozilla Labs explains: "Modern Open Web technologies introduced a complete stack of technologies such as Open Video, audio, WebGL, touch events, device orientation, geo location, and fast JavaScript engines which make it possible to build complex (and not so complex) games on the Web. With these technologies being delivered through modern browsers today, the time is ripe for pushing the platform. And what better way than through games? Traditionally, games and game developers have been at the forefront of technology, often pushing the boundaries of what was thought possible."

To kick off the initiative, Mozilla Labs Gaming will launch its first international gaming competition: Game On 2010. This will be open to all developers interested in creating awesome games using the latest in Open Web technologies.

Coming soon: 'Wave in a Box'

Polish your keyboard, exercise your fingers and stock up on coffee. It's time to start coding and de-coding. Alex North, software engineer of the Google Wave team, has announced the 'Wave in a Box' project by Google. This is a stand-alone and functional open source version of the recently terminated Google Wave. After the termination, the Wave developer community requested the company to release the code of the Wave project in the Wave protocol forums.

North says that they have already open-sourced 200,000 lines of code as part of the development of the Wave protocol "...to flesh out the existing

Opera to partner with more mobile handset manufacturers

Opera Software is in talks with more mobile handset manufacturers to include the Opera mobile Web browser,

helping boost the use of the Internet on mobile phones, says *Business Standard*. Opera Mobile and Opera Mini browsers are being used by 50 per cent of the total Internet users on mobile handsets. "India has been one of Opera's fastest-growing markets over the past few years. Today, India represents the third-largest Opera Mini user base, after Indonesia and Russia," said Shwetank Dixit, Web evangelist, Opera Software ASA.

Google code now supports any OSI-approved licence

The open source Google Code project hosting service, code.google.com, now supports any OSI (Open Source Initiative) approved licence. A post on the Google Code blog says: "We've added an option to the licence selector to allow any project to use an OSI approved licence. Simply select 'other open source' and indicate in your Licensing, Copying or similar file which licence you are using."

The post by Google open source and public sector programmes manager, Chris DiBona, also mentions: "Public domain projects are still only allowed on a case by case basis, as true public domain projects are quite rare and, in some countries, impossible. We encourage those that want to truly ship public domain to look at how D Richard Hipp does things around SQLite and emulate his style. Email google-code-hosting@googlegroups.com if you'd like to request that licence be applied to your project."
