an approximate shape of the body of an airplane (see Figures 12 to 14).

Selecting the third face on the top (see Figure 15), extrude it normally (see Figure 16) to form the cockpit. Scale it uniformly for a better shape (see Figure 17).

Loop-select the front body edge, and scale it in the X axis to give a better shape to the front part of the body. Move

Figure 34: Two opposite faces selected for side tails

Figure 35: The tails extruded

the front and back edges of the cabin, to shape it up a bit (see Figures 18 to 20).

Select the face at what is to be the back of the plane. Extrude it once. Loop-select the penultimate edge, and scale it down. Do the same with the last edge (see Figures 21 to 23).

Select the top-end face, after getting into *Face selection* mode by pressing

the *F* key. Extrude it upwards for the top part of the tail. Shape it by scaling and moving it (see Figures 24 to 26).

Select the polygons that form the windows of the cabin—the front and the two side ones. Inset them, so as to give the shape of windows (see Figures 27 to 29).

Extrude the windows out a bit. Select the two opposite polygons on top of the
