

Figure 1: RedNoteBook

Figure 2: NoteCase

node for your notebook. From this point, you can type into the right pane (corresponding to the active node), or keep inserting child nodes, delineating the structure of your notebook. To get a feel of what a fully populated notebook looks like, check out the *Help* section, which opens up a *Help* notebook.

Wiki syntax does not work, but you can use the toolbar to format your text. You will miss the bulleted list format option, though. If you visit '*Node Properties*' (click the secondary mouse button on the node), you can add tags that will help you with searching the notebook, or associate an icon with a particular node. You can also insert pictures. To use NoteCase as a journal, all you have to do is use the date/time string (a `<Ctrl><Shift>T` gets you the date string in five formats) to name a child node. You can then drill down another level for multiple project entries in your journal.

Hyperlinking across pages is possible; just select the text for your hyperlink, and use the link wizard on the toolbar. A parent node is also a page, and you can make it look like a 'Table of Contents' by creating hyperlinks to the child pages. Exporting to HTML creates a single huge file for the entire notebook, which will not suit certain kinds of content.

There is a paid-for 'Pro' version of NoteCase available, which has more features. The free/open source version seems to

have been abandoned by the author in favour of the Pro version, though it is still available in the Ubuntu repository. However, this version is available under a BSD licence, so people have the freedom to fork the project if they'd like to modify it.

KeepNote

A gem of an outliner, this one does not give you much to complain about. It is a shade better than the previous two tools. An Evolution-like interface lets you see the notebook tree in the left pane, with the right pane split horizontally, allowing you to view notes like e-mail. The user interface does not cease to amaze. You can open multiple tabs, with each tab exposing different sub-sections of the notebook tree.

There are a greater number of built-in icons to choose from, to associate with nodes. In addition to pages, KeepNote also lets you create folders that contain sub-trees of pages. Folders give an additional structural element to your notebook. Note-to-note links are possible in pages; a `<Ctrl>L` gets you going. You can type the name of a page as a hyperlink, with a list of suggestions popping up. Alternatively, you can have your own name for the hyperlink, and type the target page into the text bar that opens up at the bottom. A screen-shot feature is available, but do remember to configure helper applications in the 'Preferences' page. Sorting is possible on columns in the list view. What's more, it gets
